If your antenna is resonant do you need a tuner? I have a TS-50 that folds back at the slightest SWR and I have run a tuner between it and my amp a lot...Its no different than a rig with a built in tuner...

If I were the moderator of this group, I would promote a Wiki site and create a FAQ link directing NBs to it. It would answer tons of "top level" questions and allow the group to focus on deeper issues. The two sites could co-exist in perfect harmony. I say go for it!

Mike,

I think you've got a highly efficient idea there and totally agree with promoting both sites.

During the day, Paul Gibson, MØTZO contacted me and donated web-server, bandwidth, and domain naming.

Once we get the basic in place, we'll announce the site URL here and encourage folks to visit.

The front page will be completed soon and we can link to the FAQs from there.

Please contact either of us with any questions or issues as we proceed forward.

To start, the only Ignorant Question was the one you should have asked but now it's too late.....

The question is, "If your antenna is resonate with a less than 1.5 to 1 swr on the net frequency, is it safe to leave the tuner in line between the radio and amplifier?

Tom,

Answer: Yes.

The tuner between the radio and the amp will help as a band pass filter, deliver maximum power transfer and keep any reflected power from the amp input circuit back to your radio to a minimum. No different than a radio with a built-in tuner. If the amp is in standby or bypass, there shouldn't be any noticable effect with the amp still in line. However, if your antenna had a high VSWR (3:1 or higher) that just might cause arcing at the antenna switch inside the amp. :(

As far as your amplifier output with-out a tuner;

I ran an FL-2100B for years with no tuner and on 40 meters, depending on my frequency, my VSWR was anywhere from 1.1:1 to 2:1. Tubes can usually take more abuse than transistors and can handle it. Just make darn tut'n sure your SB-200 is well ventilated 'cause any reflected power will be dissipated as additional heat on the plates of the tubes. On my FL-2100B I just laid an additional muffin fan on top of the cabinet to help keep it cool by drawing hot air straight out of the cabinet. I didn't cut any extra holes. I just laid the fan on top of the amp where vent holes already were. And I would do what I could to keep the VSWR less than 2:1. At 3:1 you have 25% of your power reflecting back into the amp, IE, 1,000 watts out = an additional 250 watts of energy the plates of the tubes have to dissipate. That can't be good. In my opinion, the reason many of these new solid state radios now come with built-in tuners is to help protect those precious transistors and to keep the VSWR protection circuits from shutting the power down to nutt'n.

Hello again Tom,

If "persuing soon" means anytime in the next month you might order your SignaLink USB today. I called yesterday, hoping to get on RTTY for a contact with N8S before they go home, but found out they're 4 weeks back ordered. Bummer. I too have been meaning to get back on RTTY, PSK and the like but have been putting it off for too long. :(

The USB version has a 5 out of 5 on eham.com with about 2 dozen hams commenting. Very good score.

18408. FT-897D & MARS Mod

Yahoo group: FT897 (2007)
Date: 2007-04-11 21:57:36 UTC
From: dallara4
Topic: 18408 Message: 18408

I recently purchased a FT-897D. When I tried the MARS mod that is on all the mod web sites, the 4 jumper one. Most of the Ham frequencies were locked out for transmit, the opposite effect of what I was looking for. I took the radio to a radio repair shop and he got it back to normal, but no matter what jumper configuration he tried it would not open the transmit up. He thought, me too, that Yaesu had come up with a new variant of board.

Has anyone heard of anything new on this mod?

Thanks,
Chuck

Yahoo group: FT897 (2007)
Date: 2007-04-13 02:39:20 UTC
From: robert goodman
Topic: 18407 Message: 18410

Hi Tom,

Just last weekend, I got my FT-897D working remotely with HRD. I can now do just about everything with my notebook computer controlling the 897 as I can sitting in front of the rig....except now I can do it from a hotel room, our mountain home 750 miles away, etc. Actually, anywhere you have a wireless hot spot or any kind of Internet access, you have a shack. It is absolutely amazing how well it seems to work on all levels. The implications of this kind of operation are kind of mind boggling....HF (transmit and receive), VHF/UHF for your local repeaters (talk and listen), even listening to local AM/FM to catch the game if not broadcast in your remote area...

It took me less than an hour, start to finish, to get everything up and running and it really is one of those things where you will be constantly chanting to yourself, "This is SOOOO kewl...."

These experiences seem to have initiated a lot of messages and "how to" info on the Ham Radio Deluxe Yahoo Group during the past week. Instead of repeating it all here in the 897 Group, join up over there if you are not a member and look at the past week's messages for all the info that you will need to remote your 897 too.

I am finding it is almost more fun to listen and operate the radio via computer than play with the radio directly when I am in the same room!

73 and good luck with the project,

Robert AA5FR

Order the CT-62 cable from Ham Radio Outlet (or equivalent). That
connects the "Data" part of the radio to your computer. Then order a
TigerTronics "SignalLink +1 " to connect the audio portion of the 897 to
your computer. Finally, download Ham Radio Deluxe software (free) .
This will give you remote control across the internet to your rig.
Learn how to set it up. READ the help forums listed with the software.
All your NB questions can be answered there.

Enjoy.

I was having problems with an AT-897. The CAT-out port didn't work.
I sent the unit back to LDG (not the dealer) under warrantee. It was
returned with a note saying they had been unable to replicate the
problem. This happened twice. I called them, spoke to their tech
support person, and found him to be polite and helpful. He said that
maybe they missed something but couldn't explain what happened. He
offered to send me a new unit for exchange. Of course I accepted his
offer. The replacement unit came in a few days and works perfectly.
Why the original appeared to work for them and not for me is not
important to me now, although I admit to being aggravated at the time.
But all it took was one phone call and they took excellent care of
me. I was impressed.
I suggest you simply call them and explain your problem.
Good luck & 73 de Paul W1PR

I agree with Ken -- the FT-897 sounds great on FM. I listen to
Classical Music from an NPR station 35 miles away nearly every night
while waiting for various CW nets. Through a SweetSounds speaker, it
sounds great.

I just hacked together the do-it-yourself interface from a mouse extension cable and some audio transformers from Radio $hack. It's a really simple project if you can't wait for the back order. No smoke escaped from the altoids tin so far. Tonight I was listening, figuring out my software and finding settings on the digital vox. Tomorrow I'll try to put together a simple PTT keyer so I don't have to use the vox....

I know that it ties up some computer ports, but my pc was for audio production anyway. That's what the ports are for! And it helps to have the Soundblaster LiveDrive. It's a rig that installs in a drive bay that gives you 1/4 inch jacks with volume knobs on the front of the PC for both audio in and out.

Subject: [FT897] Re: LDG 897 Tuner with FT 897D

I was having problems with an AT-897. The CAT-out port didn't work.
I sent the unit back to LDG (not the dealer) under warrantee. It was
returned with a note saying they had been unable to replicate the
problem. This happened twice. I called them, spoke to their tech
support person, and found him to be polite and helpful. He said that
maybe they missed something but couldn't explain what happened. He
offered to send me a new unit for exchange. Of course I accepted his
offer. The replacement unit came in a few days and works perfectly.
Why the original appeared to work for them and not for me is not
important to me now, although I admit to being aggravated at the time.
But all it took was one phone call and they took excellent care of
me. I was impressed.
I suggest you simply call them and explain your problem.
Good luck & 73 de Paul W1PR

From: Richard
Topic: 18351 Message: 18417

You know, that is interesting about the mike gain not being above 20. I quickly found that out through reports from other hams, and I thought that something must be wrong, because I shouldn't have to adjust it that far off the default setting. It is nice to see that it actually is ok.

Subject: [FT897] RE FAQ Was Re: Good bye...

Another point for the FAQ will be setting up SSB audio.

Mic setting should never be above 20 and processor should be avoided (if you want to achieve natural sound). It is actually an audio flat-top circuit that attempts to compress audio that is usually already carrying at or near 100% info, and results in loss of intelligibility. External Speech processing options could be covered. I plan on trying a W2IHY Audio EQ and Noise Gate with the FT-897 as soon as I find a Yaesu 8 pin round connector Mic to feed into it. I already have the cable to go to the rig for it.

Date: 2007-04-13 04:01:54 UTC
From: Richard
Topic: 18375 Message: 18418

I tried listening to a few FM stations, but I found that powerful stations will prevent reception of nearby weaker ones. Probably a smaller antenna would alleviate the problem, but on the other hand, I can't see myself using a thousand dollar radio to listen to commercial FM.

Subject: Re: [FT897] No audio on FM broadcast band

Gene, the following is an opinion but I feel the FT897 does a poor job of decoding broadcast FM signals. I used it a few times to listen to the radio one company was over it would only open the squelch on the most powerfull stations. Since then I purchased a cheap FM/CD radio.

18421. Re: [FT897] No audio on FM broadcast band

Yahoo group: FT897 (2007)
Date: 2007-04-13 00:18:03 UTC
From: WØQFC
Topic: 18375 Message: 18421

So far, here are the answers:

"How high do you have your squelch set?"

"Otherwise, back to Yaesu and ask them to perform all factory upgrades in addition to fixing the FM audio problem."

"TURN THE SQUELCH DOWN"

"Be sure you don't have the radio in tone squelch mode or DCS"

"the following is an opinion but I feel the FT897 does a poor job of decoding broadcast FM signals. I used it a few times to listen to the radio one company was over it would only open the squelch on the most powerful stations. Since then I purchased a cheap FM/CD radio."

I am beginning to think that there is actually something wrong with the radio because it worked fine, with very good audio before I shut it down for a couple of days. When I turned it back on (WITH NOTHING CHANGED IN THE RADIO) it would not work on FM broadcast.

I have done a hard reset of the radio but still nothing.
I have read the manual from cover to cover and found nothing related to this problem.
Yes, I do have a FM radio, but I think that the FT-897D should work as it did out of the box!

I just emailed Yaesu and will wait for their answer. . . . .Unless some one can come up with the correct answer.

Thanks to all es 73

Hi Jerry:
I had the SSB filter in my 897D.
I found no difference in the REC or TRANSMIT of it the filter I think only helps out in a pile up when trying to get station ie. If you are contesting and you find a lot of people trying to get a distant station. This filter will help as it is 2.3 SSB filter. This helps the DSP and other roofing filter that is in your radio. Try it with out and if you can get stations on HF then do not worry. This is not needed for 2 metre or 70 cem UHF bands. or for local ham talk
Good luck.

Jerry,

If you want to work the narrow-band digital modes, the CW filter may be an asset. I bought a 897 with the CW filter installed, and first thought of swapping it for the SSB one. However, I have found it useful when copying PSK-31. The rig will do digital modes without it, but it is beneficial on some.

The SSB filter may become more of a needed item, as more and more folks upgrade to HF, with the possible crowding of the phone part of the band plan. This is an unknown quantity at this tome. FWIW, filters are good, if the budget can survive. Many folks have operated without them, but they do make life easier.

Make sure it is set for Wideband FM. The mode must be WFM,

Also, there must be enough of a signal for the muting circuit to give way to audio.

One more possibility, if you have the RF Gain/Squelch menu item selected to RF Gain, it adds an additional layer of auto-muting to FM reception that is also signal strength dependent.

I just changed this menu option from RF Gain to Squelch, and the problem you described went away,

It sounds rather like one of the older software modable 857's.

You could wide band them with software up until around the and of 2005, then the FCC complained, all you had to do to revert the mod was reset the radio.

From that date wide banding has to be done with a soldering iron.

There are several reasons for the FAQ site. First is the amount of ads that are present in the Yahoo! Search. Second, the amount of repeat questions from NB's, or new owners.

I still contend that if they were to READ THE MANUAL OR JUST PERUSE IT FIRST, there would be a lot less duplicate and un-necessary questions.

I point you to my prior post on this subject!

Dennis - N8BMB

If I were the moderator of this group, I would promote a Wiki site and create a FAQ link directing NBs to it. It would answer tons of "top level" questions and allow the group to focus on deeper issues. The two sites could co-exist in perfect harmony. I say go for it!

cw filter is a must if u operate cw and reports of more ssb punch also rx audio has more fullness to it be sure to go to menu #86 to engage the collins 2.3 filter on x mit the 897 is a really cool radio if u study the menu options like items 15 - 18 most people havent a clue what they do also keep ssb mic gain set to 15 to 20 dont use the compressor if u do 25 or less also study how and the effects of the dnr great built in tool and last but not least turn OFF the ipo on all bands n6biz gary

dalite01@... wrote: Jerry,

If you want to work the narrow-band digital modes, the CW filter may be an asset. I bought a 897 with the CW filter installed, and first thought of swapping it for the SSB one. However, I have found it useful when copying PSK-31. The rig will do digital modes without it, but it is beneficial on some.

The SSB filter may become more of a needed item, as more and more folks upgrade to HF, with the possible crowding of the phone part of the band plan. This is an unknown quantity at this tome. FWIW, filters are good, if the budget can survive. Many folks have operated without them, but they do make life easier.

Hey Dug,

You're on to me. A few years ago I did exactly that. Sort of all buggered up on a perf board. It was ugly but it worked. The SignaLink USB has it's own sound card. That's gud because I didn't want to have to go climbing around under my desk swappen out cables ever time I wanted to work RTTY. Did you interface to the mic & ext spkr jacks or the data jack?

Hello Jerry,

It all comes down to selectivity. This means enhancing your radios ability to receive one signal eventhough there is another interfering signal close by.

To answer your question in my case upgrading to after market Inrad filters did make a difference. I especially noticed this during the last Field Day where I operated on a rather large log periodic and a very crowded 20m band. I tried the other settings and DSP on the rig and those settings help, however adding the filter made a further difference.

I have some filter comparisons charts on my website for the FT-897D:

http://www.ve6xl.ca

I can also send you some clips or tie you in over an audio stream if that helps.

I have the 300hz and 500hz filters for my FT897 and I use one or the other for every QSO on PSK31. A narrow filter often makes the difference between Q5 copy and no copy when trying to copy a weak signal when there is another stronger signal nearby, which is usually.

I went for even uglier construction and skipped the perf board. I hot glued the transformers to cardboard to hold them in place. UGLY but it works. I understand the advantage of the usb soundcard, but with the jacks on the front of my PC I don't have to dig around. And my wife let me buy the rig....my ham budget is blown for a long time.

I interfaced to the data jack. The mouse extension cable is a perfect match. A few minutes checking continuity to figure out which pins match which wires is a lot easier than soldering up a new connector. Actually it was better than perfect in a way. Since the leftover end has a female connector I can make an interface to the interface and rig up a connector for my old rig as well.

18438. Frequency Calibration - Alignment

Yahoo group: FT897 (2007)
Date: 2007-04-13 16:14:11 UTC
From: ve6xl
Topic: 18438 Message: 18438

I have a question regarding the TX/RX frequency alignment of the FT-897D.

Does the following still apply even for the "D" model?

- Connect frequency counter to TP1032
- Adjust TC5001 to 67.875000 MHz

I cannot find TP1032 on the PCB.

Thank-you....

18439. Re: FT-897 Wiki instead of Yahoo?

Yahoo group: FT897 (2007)
Date: 2007-04-13 17:02:11 UTC
From: mrmsudawgs
Topic: 18351 Message: 18439

Respectfully, I disagree.

I passed my CW test in January 2007 as part of my upgrade to General. I went out and purchased the FT-897D and studied the manual intently before using it. I am also a Mechanical Engineer and a lighting designer. I tell you this not to brag but to inform that I'm quite capable of reading, learning, comprehending, and even making educated guesses.

However, upon reading my manual I was stumped by terms like AGC, IPO, ATT, IF Shift, DSP Bandpass Filter, etc. So, I dove in and I Goolged around to find answers. I went to eHam.net and posted numerous questions - questions I could not find the answer for in the manual. With the manual, I could discover what an AGC or IPO was and how to turn those functions on and off. What the manual did not tell me was why I would ever want to turn those functions on and off or when I should. These are answers that an Elmer could answer for you but are not found (easily if at all) in the manual.

Of course, it is not up to Yaesu to teach us how to be good operators but only to tell us how to operate the rig in the first place.

Case in point - Yaesu uses 1/2 of page 63 to explain how to hook up at CT-62 cable and gives a very brief explanation as to what function this will serve as far as using data logging software or other "third party" software. This explanation and diagram are quite adequate to explain "how to" install the cable and even somewhat adequate as to "why" you would in the first place. Now, is this enough for a NB that has never set down in front of an HF rig nor has access to an Elmer to help out? I believe not.

Again, it is not up to Yaesu to teach us how to be good operators but only how to operate the rig. The rest we must learn on our own which is why this forum exists in the first place. A Wiki will simply let us add to the manual our own knowledge and experiences that will fill in the question of "Why" along with "How".

My 2 cents

Kindly

Glad to hear you passed your cw test (dead horse) and that you are of the elite number of hams who are educated (by postings - it appears many are not - I am referring to U.S. hams).

I would still agree that a FAQ would serve many who had technical questions, such as those you refer to, and those "repeat" questions such as 897 Vs 857 (hence the 'Frequently' in "FAQ"), etc. etc.

I agree that Yaesu is not responsible for teaching us to be better operators, rather getting us to be able to operate their equipment, their manuals leave MUCH to be desired.

However, a FAQ would be a good idea. Next problem; Getting NB's or NO's to read it before popping a question that would be covered. Maybe require it be read BEFORE granting full access to the group?

18443. FT-897, FL-7000 and CT-58 Cable

Yahoo group: FT897 (2007)
Date: 2007-04-13 19:45:11 UTC
From: David Inger
Topic: 18443 Message: 18443

The '897 manual provides information for interconnecting the rig to the Quadra (VL-1000) amp while using the CT-58 cable for automatic band changing. Does anyone have experience using the "897 with an FL-7000 amp and using the same CT-58 cable for connecting the rig to the amp for band control? I have not found a specific answer to this question in the archives.

Thanks for any help.

The CT-58 cable has DIN type connectors on both ends (mini-DIN on the FT-897 side). The FL-7000 has a Molex-type connector in for the band data cable. The pin-outs may be the same, but the CT-58 wont work. Hope this is of some help to others..

18446. Re: [FT897] Re: FT-897 Wiki instead of Yahoo?

Yahoo group: FT897 (2007)
Date: 2007-04-13 20:53:43 UTC
From: Dean Gibson AE7Q
Topic: 18351 Message: 18446

And how are you going to see that they read it? Because they SAY so???
Are you going to give them a quiz?

Witness http://www.ae7q.com/show/AppByType.php?TYPE=A -- these are amateurs who have certified under penalty of perjury that they are a "former holder" of the callsign that they are applying for. As you can see, the majority are not "former holders". It's not like they click on the "former holder" button to get an advantage; they do not. They click on the "former holder" button because THEY ARE UNWILLING TO READ ONE SENTENCE on the application web page. That sentence (explaining that they were certifying to having the requisite documentation regarding being a "former holder") didn't use to be there, but about two years ago, I petitioned the FCC to add it, thinking (naively, as it turns out) that the issue of amateurs erroneously applying as "former holder" was because they didn't UNDERSTAND. Well, the addition of the sentence didn't change the small but persistent percentage of amateurs who click on "former holder" because they can't be bothered to read one sentence. (You will note that the list is NOT limited to those who are new to amateur radio.)

So, if some amateurs won't read what they are certifying to under penalty of perjury, what makes anyone here think that you can force them to read an FAQ (let alone a manual)?

I remember a rather tart message exchange I participated in here a couple years ago:

1. I created a simple web page (http://www.ae7q.net/doc/public/MH-59.html) which described a modification a problem. As you can see, not much to read.
2. Someone posted here a message asking a question about the modification (quoting in their message the above link), when the question was answered on that web page.

I have had multiple questions about another web page (http://www.ae7q.net/doc/public/ATAS-120.html), asking if I have "additional pictures". My Gosh, what do they need additional pictures for !?!? Is there anything that is unclear (even for new amateurs) on that page? if so, tell me.

This problem is not limited to amateur radio (although I am surprised at how much it has permeated amateur radio). We live in a "TV" and entertainment culture, and with a spoon-fed educational system. Heaven forbid that you should actually have to spend some time and LEARN something.

18447. Re: FT-897 Wiki instead of Yahoo?

Yahoo group: FT897 (2007)
Date: 2007-04-13 21:32:37 UTC
From: Terry
Topic: 18351 Message: 18447

First, thanks to all that did take the time to answer my A vs. B question. I did research many radios, joined many groups, (Found many answers without a single posting. We are talking thirty hours not minutes of searches, in yahoo groups it matters if you search ft-897 ft897 or just 897), and I read many reviews. (Though, does ARRL ever write a bad one?) In addition, echoing Richard, answers don't always come from manuals and often take weeks to find or confirm. Settled on Yaesu, but before spending what took me a year to save (Without affecting my family) I was hoping for a little extra assurance this was the one. In my posting I shared my SPECIFIC needs-marine, club, and home along with a private email address for replies. Again many thanks to all replied, and to this day I am still conversing with these some operators privately about everything including pulling insulated wire from bow to stern over the spreaders. lol. Truth be told I've learned of a new radio that is not even posted on the mfg's home page, (450) and the 897 has a TCXO9 included (need to read about this now, .5ppm?) and I because of other points made I may switch my choice of radios.
Anyway, a FAQ would be a great place for us NBs to start any search for info. A list of Mods and their "purpose" would be a great benefit too. This info is not in the d manual.
Lastly this being my second mailing, (maybe last, Hi Mr. Admin ,lol :) I'm here defending the only other posting I ever really made to a radio group. All which seem strange since the group (hams) is about communication, the web page (yahoo) is about communication, and the problem is about well.. If there is trouble in asking questions here I just wonder . The posted goodbyes has many valid points but why such a tone?

Chuck,

Based on that info, there is a solder bridge or jumper (something representing an electrical connection) on the circuit board. My guess would be on J1002.

Whoever has the rig will need good lighting and magnification to find it.

Download this

http://f1.grp.yahoofs.com/v1/UO8fRvBnC0SVKqrQxigC0bd5jhCzRw7yYqt9I0ZMc7zI9GVCJaV_2KoU6efW5w7q3lXVEh8rsDmlgY88QJExiwDkC84A7g/Mods/ft-897_jumper_sheet.gif

and print it out to see the matrix.

It is for the FT-897 (Non-D), but I believe the similarities are close enough to isolate where the solder bridge is.

Subject: RE: [FT897] No audio on FM broadcast band

Make sure it is set for Wideband FM. The mode must be WFM,

Also, there must be enough of a signal for the muting circuit to give way to
audio.

One more possibility, if you have the RF Gain/Squelch menu item selected to
RF Gain, it adds an additional layer of auto-muting to FM reception that is
also signal strength dependent.

I just changed this menu option from RF Gain to Squelch, and the problem you
described went away,

First, thanks to all that did take the time to answer my A vs. B question. I did research many radios, joined many groups, (Found many answers without a single posting. We are talking thirty hours not minutes of searches, in yahoo groups it matters if you search ft-897 ft897 or just 897), and I read many reviews. (Though, does ARRL ever write a bad one?) In addition, echoing Richard, answers don't always come from manuals and often take weeks to find or confirm. Settled on Yaesu, but before spending what took me a year to save (Without affecting my family) I was hoping for a little extra assurance this was the one. In my posting I shared my SPECIFIC needs-marine, club, and home along with a private email address for replies. Again many thanks to all replied, and to this day I am still conversing with these some operators privately about everything including pulling insulated wire from bow to stern over the spreaders. lol. Truth be told I've learned of a new radio that is not even posted on the mfg's home page, (450) and the 897 has a TCXO9 included (need to read about this now, .5ppm?) and I because of other points made I may switch my choice of radios.

Hello Robert OM,
Thanks for your reply first,
I'm exciting now to know how HRD with PCs,routers through LAN with one FT897 could expand my ham life.As I usually move from two continents and have few fields to install big antennas, your suggestion encouraged me to jump to the next step.
Now I submmited to HRD group in Yahoo,and now plan to have one QTH in a country side to enjoy this remote control operation on HF from my room in the future.Thanks a lot.Have fun, Tom AH2E

Hi Dennis,
I understand what you want to say and remember this remote control QSO is partly or mostly done by the skywave propagation between two locations though, I may chose this way partly by internet because I have so restricted field to install even a small antenna to enjoy HF better than
virtual QSO in the internet.73 Tom in Kyoto

From: K6LMP
Topic: 18456 Message: 18456

My print copy of the April 2007 issue of QST finally arrived today. I had been eagerly anticipating its arrival so I could read the article by Nenad Rotter, 9A5AN, describing his microphone port card.

The article includes (in a footnote) a link to a binary image with the PCB and parts layout diagrams for the project. However, the file actually exists on the ARRL web site at a different location than the published address.

I have emailed ARRL and suggested that they change the filename to coincide with the published filename. In the meantime, for anyone who wants it, the file currently is available at:

http://www.arrl.org/files/qst-binaries/RotterQS0407.zip

Nice project, Nenad! I intend to build it very soon.

18458. [FT897] LDG Tuner Sticks

Yahoo group: FT897 (2007)
Date: 2007-04-14 23:57:04 UTC
From: Adam Filkins - KD8CCX
Topic: 18458 Message: 18458

Hello,
I have a very strange occurance that I can't understand. I have a 897D and the AT-897 Tuner from LDG. When I tune on 75 meters, it seems to "stick". Essentially it tunes just fine, it just doesn't release the carrier.

Any help on this would help. I am thinking that maybe a flash of the firmware might be in order.

Thanks in advance for your help and 73's

Adam - KD8CCX

Sounds like RF may be getting into things. How is your grounding
situation and how far are you from the antenna? Does this "sticking"
occur at minimum power, maximum, or yes?

From: it9xxs
Topic: 18407 Message: 18460

Hi Tom,

some time ago I made two small programs (MyRigPeater Server and MyRigPeater Client) to use the FT-817 from remote internet locations (one program runs on the PC connected to the transceiver via the RS-232, the other one on the remote PC).

I never finished the program, but it works (with some bugs) and I would be happy to make you test it. The program is freeware, virus-free and I made it just for the pleasure to make it. It should work with the FT-857 and the FT-897.

You can download the programs from my website:
http://www.dexxsterlab.com/MyRP/MyRP.zip
and read the description there's a .pdf file) at:
http://www.dexxsterlab.com/it9xxs/myrp.htm

On each side you must edit the .ini files with the appropriate IP addresses before use.

Best 73's,
Giovanni IT9XXS

Date: 2007-04-14 21:50:35 UTC
From: Darrell W4CX
Topic: 18408 Message: 18463

I have an absolutely perfect FT-920AT with INRAD CW and SSB filters in original box with mic, cables, manuals, as original. Always pampered in my no-smoking shack. The 920 has both the INRAD #709 2.1Khz SSB filter and the #701 400Hz CW filter installed. (More details at http://www.qth.com/inrad/ft-920.htm). It also has the FM option installed!.

I'm looking for an FT- 897D equipped with the FP-30 internal power supply, FNB-78 NiMH battery, the CD-24 charge adaptor, and CW filter. Must also have original packing materials, and standard accessories. We're close to an even trade if you have the matching antenna tuner. If not, we can talk about a cash differential.

What do you have? Thanks and 73. Darrell W4CX

From: Jim
Topic: 18375 Message: 18464

Hi all,
My first post here..... Elaine has brought up an interesting point.
Are you using a Duplexer on your rig so that only one feed line will
handle all the bands to one antenna? There are two duplexers made by
Comet that will work on the Yaesu. One will allow frequencies in the
FM broadcast band and the other will not. Here are their specs:

CF-530 HF/6M/2M-70cm Duplexer
Band Pass
1.3-90MHz
125-470MHz

CF-706A
HF/6M/75MHz-70cm Duplexer
Band Pass
1.3-57MHz
75-550MHz

Hope this helps,
73 de Jim

Just "momentarily" press the F key and rotate the MEM/VFO knob till the
lower left corner displays MFi. Then either press the A button. This
will toggle you through PWR/ALC/SWR/MOD. Pressing the B button will
toggle the display through PWR/MOD/SWR/ALC. It is on Page 16 of the
operating manual.

Remember guys, for some folks, this is just a hobby. If we do what the typical guy does, we open the box, play with the new gear and use the mode we bought the radio for. If it happens to be in that "default" mode, we never have questions. But, as we explore the features of this radio, we have questions. This forum makes it easy to ask (most times).

Anyway, if looks like there is a good bit of discussion. I hope folks don't get driven away. Ask away, I know there are folks out there that will answer the questions regardless of .... There are no "dumb questions".

Dean , from the book :-

''The multi-function Liquid-Crystal Display includes attractive
backlighting, which may be disabled for battery conservation.
The display includes bar-graph indication of power
output, ALC voltage, SWR, and modulation level. Also include
are a number of operating status icons, as well as the
function displays for the three operating function keys (A,
B, and C).''

Ive used the meter to set the ssb audio gain with the ALC function ,
but that was a while ago when I first got the set (xmas 2006) ... But
now, it dosent want to 'play' ..

The question is .. Have I missed something , I dont think so , but
with all those mem's .. is there something that can be set that .

stops the meter from changing ? sort of kiddy lock ? nice to know ,
before I call the shop monday :-)

Tnx - G ..

Ok Tnx for the 'info' but .....

Yes I can select using the 'MFi' and set the TX meter function , however , Should you not be able to select directly from the memory mode number ie f , slect , dial then f to store .. which my set wont do ...

I cannot see a quick recall for the RX function , other than to use the memory mode and recall 060 , which as in the tx function, will not select using the 'f' key ....

Have I missed a menu for the rx ?

Tnx Graham ..

Are those 10K resistors and the 10K pot carrying
any current? Could they be 1/8W or smaller?

I am guessing that the pot is rarely touched, yes?

This circuit looks as though it could be built into a
"fat" connector housing that plugs into the ACC jack
and acquires its power there as well. (Extra room is
available if one uses right-angle coax connectors.)

A microswitch could be run under the case and tacked
just under the front edge by the headphone jack.

This would meet the goal of an "on-board" device and
leave the battery compartments free for batteries,
a battery & AC charger, transverters, and other
interesting devices.

WDYT?

Dear Martin, M0ADY,

The FT-897D has a reputation for sounding
"pinched" and one Ham, WB1FPA, offers a plug-in
2.7KHz filter to help with that on TX (it is
also available to switch in on RX).

Perhaps the "hollow" sound you detect is the
same that others describe as "pinched"?

Once the level has been set is there a good reason
to keep the pot - one could substitute a fixed resistor?

Also, would a multi-position switch selecting among
fixed resistors be OK? (Pots tend to handle environmental
changes less well than switches and fixed resistors.)

I keep forgetting about the 897 A-B battery switch.
Elegant solution! (I think the author of the 222MHz
transverter-in-the-battery-compartment mod also used
that switch.)

I do own a MFJ Travel Tuner but am expecting to need to use
an HF amplifier mobile/travel trailer portable, so my MFJ-984/
Dentron 3000A manual tuner (modified to better handle 160 & 80M)
will probably be used.

The key to keeping things inside the case is simplicity
and freedom from potential damage in moving the rig around.

I was unclear in my question. What I meant to say
was that some bands (and some circumstances) generally
require higher power. Here is what I was thinking:

6 & 10M are fine on 10 Watts when open but if one
wants to force a QSO under weak conditions will require
some extra juice.

15 & 20M seem to generally be open or closed and
100W is rarely needed -- except to reach stations
with poor antennas or with local receive QRN/QRM,
and during contests.

40, 80, & 160 appear to benefit more from an amp then
the other bands and from years of monitoring 160 & 80m
seem to have a higher percentage of ops reporting the
use of amps than the other HF bands.

Running inefficient antennas mobile/portable all of
these factors would appear to be amplified.

WDYT?

> Which band would work the best? If the amp. is flat in frequency

I have two solid state amps with four 2SC2879 devices
in each. They claim 500-600W PEP SSB.

Let's say 500W each PEP for the sake of the argument.

If I combine the pair for 1KW on 160-10M will the
single S-unit I gain from combining them matter
at the receiving end?

If so, where the most; 160? 40? 20? 10?

The context will initially be into inefficient
mobile antennas, and into less inefficient portable
antennas when parked and operating from the travel
trailer.

> unfiltered amplifiers on amateur radio!---73, KC3VO, Bob Curry

If they were commercially made, true, but thousands
of homebrew amps are on the air around the world
which either use outboard switched filters or no
filters at all.

Some long pre-date newer regs for spectral purity
and others have been built or modified by Hams with
little care for spectral purity.

I would never consider using a modified CB amp on Ham
spectrum without filters, though I know that hundreds
of Hams - perhaps more - do so every day.

I doubt that any of the homebrew one to five tube
transmitters and transceivers built today based
on old designs even come close to FCC spectral
requirements demanded for commercial gear. The FCC
requires Hams to assure that every transmitter meets
the regs but it is unlikely that 1% of Hams are able
to meet the regs.

Few Hams even own a dummy load to test off the air,
as is require.

Fewer still own a spectrum analyzer, which is necessary
to verify a legally output. (A few years ago the West
Central Florida Tech. people provided a FM Modulation
Analyzer at local Hamfests. The *majority* of 2M HTs
and mobile rigs presented failed to meet specs.)

Only one switched filter is necessary on pair of quad
of combined amps -- and that following the combiner --
located at the output of the two (or four) amps.

When one rescues an illegal CB amp and re-engineers
it for legal Ham use on HF an outboard switched filter
is about the only option.

I am considering an on-board 6M bandpass filter for
an amp modified from 11M to 6M as there is room for
that if I remove the driver stage.

Are you saying that we should look at the two fixed 10K
resistors as part of the 10k pot in the voltage divider
circuit?

I was seeing them as fixed values whereas the pot could
go from 0-10K at the "center tap" point out to the ACC
Plug.

<--- (+)BAT(-)--[=10K=]--[zeroK<--|-->10K]--[=10K=]--|
To | |
Tune variable ohms tap | # GND
Switch \/
|
To ACC Plug

Do I see this correctly, please?

As for a source of 9V might one just use a 9V zener off the
12V supply? (No way do I want to fuss with a 9V battery.)

Question, please? Why not just use a 5V zener off the 12v
power supply and send that to the ACC Plug to force 5-10
watts of tune-up output, please?

What would be the difference between that and this circuit?

> So I take it the "ground" is just a reference symbol and not a true
> earth ground, and that one 10K pot comes off 1 and 3 then... I'm

18485. Palomar 900V or Elite 600 Schematic?

Yahoo group: FT897 (2007)
Date: 2007-04-03 16:21:56 UTC
From: kd4e
Topic: 18229 Message: 18485

Anyone have schematics for the Palomar 900V or
Elite 600CB amps?

I will be stripping out the transformers and
splitter-combiners and replacing them with ones
appropriate to 160-10M Ham ops.

After that will add a switched filter to clean
up any junk in the output.

I know that Hams use them on 40-10M unmodified
but want to be certain that mine meet FCC specs.

Yours is definitely the most elegant solution
and keeps the battery compartment free for
other purposes, such as the 222 transverter
mod or the built-in AC-adapter mod.

Sure appreciate you sharing it!

Thank you for the recommendations!

We will be traveling briefly then parked and
living in a 30' travel trailer for 3 months.

Then we will be touring around the country
for 3 mos, then stationary again for 6mos as
our house is completed.

I suppose I should use the term "RV-portable"
to clarify what I mean vs "Pedestrian-portable".

:-)

I had a 6M problem -- added some clamp-on
ferrite donated by a friendly Ham neighbor
and problem solved.

One went on the mic lead and the other on
the HF/6M coax.

You need to put some toroids on the coax
and mic leads. That cured it here.

Hi Graham

You seem to be missing the fact that functions 060 and 061 do not have any effect on the LCD bargraph meter display at all. They ONLY effect an external analog meter that you can plug in via the jack under the bottom of the front panel.

MF "i" is the way to change the function of the lcd display in tx, BUT it cannot display Voltage, only PWR ALC SWR and MOD. It always displays Sig Sgth in Rx.

Topic: 18494 Message: 18494

Ok I have searched the archives and found nothing on this. So here goes.

Has anyone had any experience with the Radio Mate by bhi?

I have my ft-897d installed at the shack but I have to stand up to
reach the radio. For 95% of my useage its fine but if the Radio Mate
allows me to put it on the surface of bench it would really be helpful.
If anyone has this unit how do you like it?

Thanks

18496. LDG FT-Meter

Yahoo group: FT897 (2007)
Date: 2007-04-16 16:29:17 UTC
From: w4wb
Topic: 18496 Message: 18496

Recently LDG introduced an enhanced version of their versatile FT-Meter for the FT-897/D and FT-857/D. The original version FT-Meter provides the same display capabilities as the enhanced version, while the enhanced version has an off/on switch and cool blue back-lighting.

For those interested in saving some money, we are offering factory-fresh original FT-Meters for just $29. Very limited supply.

For more information, please see http://www.w4wb.com/LDG/FT-Meter.htm.

From: Dennis
Topic: 18462 Message: 18497

The answer is...NO

Menu #60 is for an EXTERNAL ANOLOG METER ONLY!!!!

The Multi-Function Menu is for the RADIO'S METER ONLY - 2 seperate "circuits", so to speak.

The confusing thing about this and the 857 (same radio basically) are the menus, I would have to say. Why the manuf. couldn't set the menus differently, ie - the MF menu for the radio adjustments and the "internal" menus for external stuff (or vice versa)- is somewhat baffling. Here you MUST go either way OR BOTH, depending on what it is you are trying to achieve.

Hope this somewhat clarifies. Even though it doesn't state specifically in the manual, it is IMPLIED - if you read it carefully!

Dennis - N8BMB

Ok Tnx for the 'info' but .....

Yes I can select using the 'MFi' and set the TX meter function , however , Should you not be able to select directly from the memory mode number ie f , slect , dial then f to store .. which my set wont do ...

I cannot see a quick recall for the RX function , other than to use the memory mode and recall 060 , which as in the tx function, will not select using the 'f' key ....

Have I missed a menu for the rx ?

Tnx Graham ..

From: ai4fs
Topic: 18499 Message: 18499

I am looking at a battery solution for multiple radios, including the FT-897. A friend has purchased a Powerport 73 from http://www.powerportstore.com/DC%20Prod-AR.htm#PowerPort%2073 and has enjoyed it.

My only concern is running the 897 through a lighter lug. Bear in mind that I have no intention of running this thing at any more than 10-20 watts, so I don't think it will be a problem. But I just wanted to hear some other opinions.

Additionally, anybody know where I can get an extra power connector for the 897? Is this something that can be purchased from somewhere other than Yaesu (such as Mouser)?

Thanks,

Neil - N4NI

Many people can't get the information they need from technical documents. People are taught to read prose when they are young children. They are often taught to read poetry in high school, with mixed results. (Remember the difficulties people had with poetry in Literature classes in college?) Most people have never been taught to read technical documents at all. I've found that most college students almost never read any of their text books.

There are many ways of learning, and each person has ways that are easier for them; many have ways that do not work for them at all. The most commonly noticed difficulty is probably dyslexia, because it causes problems with the prose taught in elementary school. Others have problems with visual or auditory learning. These are often seen in people with above average IQs.

I have been amazed at the number of people who can't read a map, no matter how one tries to teach them. Others can look at a map once and fully understand and remember it, but can't follow verbal or written directions very well. Even with verbal directions, some seem to need them in terms of street names and compass directions, others with street names and relative directions, and still others with landmarks and relative directions.

When developing documentation of my computer system/software architectures and designs, I drew different kinds of diagrams for different people. While the text was normative, many people would only use the diagrams. I found that some needed a hierarchical set of diagrams, with each one only having a few details; others, mainly programmers, threw the hierarchical set away immediately and kept only the one diagram that had every piece of information on it, my "quick reference" picture.

While teaching programming courses, I found that I was only successful as an instructor if I presented the same information in different ways, tailored for different "learning styles." When I am learning something new, I look for the smallest reference work available, as well as a few practical examples; the reference works appear to be useless to most people for learning an entirely new area--they need tutorials instead.

I'm eagerly waiting for my old house to sell so I can buy the FT-897. I don't have the radio, but I've read the manual several times. I've also read the manuals of the other radios that I considered, as well as for the accessories. For me, reading the manual is automatic; it's just how I do things. However, telling somebody that I don't know very well to read it instead of asking questions would be like me telling somebody driving from NY to LA to just read the map--I don't even know

if they can read a map.

So, I reserve saying "RTFM" for somebody that I have enough experience with to know that they can read the manual effectively, (which also implies that the manual is effective), and they were supposed to have already read it, but didn't. (I do especially like to say it to the person who wrote the manual.) I'm not likely to find that situation often in a forum such as this.

This is much like the situation that emergency communications people prepare for, and they have developed standard ways of doing things among themselves to enhance interoperability (not to mention safety). Several operators, several radios, several power sources -- all of those things can be interchanged in the field. You might consider reading up on those methods to see what you can adopt.

Briefly, 12V lead-acid or gel-cell batteries, Anderson Powerpole connectors, standardized current distribution buses, and fuses in the right places.

ARRL publishes a book, _Emergency Power for Radio Communications_, by Michael Bryce WB8VGE, that contains lots of good info including the basics noted above.

I found a lighter plug at Radio Shack that takes banana jacks and has screw knobs with thru holes for power wires so enables more than one way to connect your gear. Works well with my 20 amp auxiliary power plugs in my 2001 GMC 2500HD pickup.

18508. SWR display

Yahoo group: FT897 (2007)
Date: 2007-04-16 18:21:17 UTC
From: Kostas Ioannidis
Topic: 18508 Message: 18508

The meter in the diplay of the 897 can be configured so as to display SWR . But there are not numbers under the display so as to know the exact SWR ! Does anyone have any clue? The manual is not helpful.

Ok Thanks for the info . Well that looks about the end of the line ...

I need to get a external meter before 10fm opens up .. I see the book
mentions a series pot to set fsd, whats the source voltage / impeadance
of the 1mA feed ? or anyone know what the total resistance of there
external meter is ?

G ..

Ok ... Well I'm glad thats over ...

Simple question, whats the combined meter and series trimming
restance needed to achive 1 mA fsd ? , i take it the 'S' function
track's the the bar graph ie its a log drive function ? what of the
FM centre zero, linea or log ?

tnx G ..

Hello the Radio Mate is a nice addition to any shack. I have used one
for some time now. I mostly use it on my FT 817.It works just as well
on the FT 897.
1. Programm 20 memories and recall from keypad.
2. can switch VFO's
3.Direct entry
4.Change mode
5.Do split
6.Tune from tune button on pad.
7.Can lock dial and still change memories from pad.
8.Has tone and blink to confirm action completed.
9. All this from the keypad.
Its a great tool for anyone with trouble seeing the display on these
radios.
It is great for those that have fat fingers.
Just a very useful in the shack for me.

18513. FT-897D Correct or Current Jumper Settings

Yahoo group: FT897 (2007)
Date: 2007-04-16 17:18:11 UTC
From: joel_c_schieffer
Topic: 18513 Message: 18513

Hello everyone. I am looking for some help with the jumper settings. I have read everything available about the settings but there are some differences with my radio. I have a radio type A2 according to the original box but the original jumper settings are on JP1001 and JP1002. There was no jumper on JP1006 as the jumper guides say there should be. I have found by experimenting that if I remove the jumper from JP1001 my radio changes to extremely narrow 144/440 bands and looking at the original jumper settings page, ALL radios have a jumper on JP1001. I currently have jumpers on JP1001, JP1007, JP1008, JP1009 and it seems to somewhat work.

Does anyone have more information about what jumper settings would work the best. I am trying to open up the TX/RX as much as possible in case of emergency communications. Any help or advice would be appreciated. Thank you.

The meter is an APPROXIMATE measure from 0 to 3. Basically, if you are getting a high reading (ie, the meter is peaked), the SWR is over 3.

18519. Re: [FT897] SWR display

Yahoo group: FT897 (2007)
Date: 2007-04-17 20:44:58 UTC
From: Dean Gibson AE7Q
Topic: 18508 Message: 18519

Ah, not from "0 to 3" but from "1 to infinity". And it's not linear with respect to SWR. Further, an SWR of 3 occurs when the meter is at EXACTLY 1/2 scale (see below).

However, the meter IS linear with respect to reflected voltage, and there is a computational relationship between reflected voltage (%) and SWR. See http://en.wikipedia.org/wiki/Standing_wave_ratio -- SWR = (1+V)/(1-V), where V is the ratio of reflected voltage to forward voltage. That also means V = (SWR-1)/(SWR+1).

I think most of the confusion about SWR would be eliminated (and also make some computations MUCH easier), if amateurs (and the industry) would think about reflected power instead of SWR. For example, if you have a 100w transmitter, and you don't want more than 5w reflected back into the transmitter, then you want a V of 0.22 or less (since power is proportional to the square of the voltage), which is about 1/4 full scale. Of course, a V of .22 is an SWR of 1.56, but who cares? What you care about is how much reflected power is being dissipated in your transmitter.

Well, let's see here.. In a base station capacity (as he states he will be using the SCREWDRIVER), the BEST antenna would be as I stated... NOT a screwdriver.. It is well known that a horizontal antenna picks up less noise than a vertical. Or, am I mistaken on the point that a screwdriver is a vertical antenna?? Here, I use a dipole with no problems. It is oriented E-W but has no problems RX or TX N-S.

So, the BEST antenna again, would be either a Yagi or a Dipole - NOT A SCREWDRIVER! If you have the room to put up a vertical, you have the room for a dipole (IMO) unless there are restriction or similar. In that case, if you have trees, you would be better off with a stealthy dipole (like I use). Ain't gonna be seen unless someone is looking for a thin wire running through the trees. Just need to be sure to "hide" that feed line! Easily done if you THINK about how to do it FIRST.

THEREFORE, ADRIAN, I READ THE MESSAGE! AND I STILL THINK THE SCREWDRIVER IS NOT THE BEST CHOICE!

Dennis:
Horizontal antennas are fine, depending on where you want to talk and how high they are. Please see the following URL for some elevations plots of dipole antennas at various heights on 80 and 40 Meters.

http://www.co.missoula.mt.us/acs/antennas/NVIS%20EZNEC.htm

The point here is that if you want to snag some DX you need a low-angle of radiation. Unless you can get your antenna up pretty high, a vertical is going to have a lower angle of radiation than a horizontal dipole on the lower bands. This is part of the reason that you tend get more noise with a vertical -- because it's hearing more signals from farther away. Of course the comparison all depends on the the antennas. An inefficient screwdriver vertical over a poor ground is going to be a looser to just about any good horizontal dipole. However, a screwdriver used to feed a taller vertical wire with a good ground system may not fare all that bad. As such, a screwdriver antenna can be moved from car to home and still be useful if tied to a longer wire and better ground.
One other thing to note is that horizontal dipoles at lower heights loose their typical butterfly horizontal pattern and tend to be more omni-directional. This could be why you do just as well in all directions with yours.

18524. FS Smart Automatic Antenna Tuner 200W

Yahoo group: FT897 (2007)
Date: 2007-04-18 00:56:08 UTC
From: moonwalker888us
Topic: 18524 Message: 18524

Hi,

For sale, brand new in box Smart Automatic antenna tuner.

This is OEM of MFJ 926 Antenna tuner.

Please email if you are interested.

http://www.mfjenterprises.com/products.php?prodid=MFJ-926

For sale at $329 + $20 Shipping.

73,
Jim

18525. 897<->FC30 cable

Yahoo group: FT897 (2007)
Date: 2007-04-17 21:03:07 UTC
From: bownes
Topic: 18525 Message: 18525

Does anyone have the pinout for the 897 to FC30 cable? I know it is 8 pin male on both ends, but is it straight through or something else?

Thanks,
Bob

18526. PSK31 / SSTV

From: Randy Charles Ford
Topic: 18514 Message: 18527

First, just to be pedantic, Jerry asked "which", not "what", "seems to perform better with the 897D?" Since "which" is a definite relative pronoun, unlike "what" which is indefinite, the question only applies to the antecedent "Tarheel or High Sierra." Of course, sometimes we can use advice for which we don't specifically ask.

Now for the potentially useful part: Do the mentioned antennas differ in their ability to tune longer, random lengths? If one were to string a wire in trees, as a vertical or inverted "L", and clip it to the screwdriver when not mobile, would one screwdriver antenna tune it significantly better than the others? How would they compare for this use to a tuner such as the SGC-237 with a whip with the longer wire attached? (I'm assuming the wire may have to be cut to avoid certain lengths that wouldn't tune properly, but it should tune all bands that the screwdriver/tuner can handle.)

18528. Screwdriver Ant

Yahoo group: FT897 (2007)
Date: 2007-04-18 11:02:32 UTC
From: CincyCouple
Topic: 18528 Message: 18528

Didn't mean to upset anyone. I have a SGC tuner with a longwire (only 33 feet in my case) and a multiband Cushcraft Vertical at my home. I was just wondering if anyone had any experience, good or bad, with Tarheel / High Sierra and the D. While the screwdriver will not be my primary home ant, I do intend to make a mount for it on the roof.

Chuck and All,

Some good info there Chuck. I have bookmarked those plots. The only thing I might add is that it is my understanding that the main reason verticals are more prone to noise is because most "noise" is vertically polarized. Thus, with a horizontal antenna, you get some attenuation effect on noise due to cross polarization. Isn't that true?

Dear Jerry~~

Sorry no one replied to your question about screwdriver antennas.

They work fine; especially for shorter range work like local
area 10 meter nets-- and do quite well at long range too if you
accept the fact that antenna height above ground does effect
their performance.

I use an old DK-3 [see http://www.hamradiotoys.com/dk3.htm]
using a mirror-mount base on a short piece of metal driven into the
ground. A few radial wires attached at the base shield nut will
act as a good counterpoise. No outdoor antennas allowed here --
so this make a good 'stealth' set-up behind the shrubs.

I use the screwdriver for short range USA DX-- and an attic dipole
for Europe/S America.

Have not tried mine on the car-- but neighbor has Sidekick that
he raves about.

Short answer: Screwdriver antennas work great. Go ahead and get one.

Chris~~

1)The CAT cable controls the rig-- for example if you would use the
great (free) Ham Radio Deluxe software.

2)A sound card interface (like a RASCAL) is needed between your PC
soundcard/serial or usb port-- and the DATA port on the 897.

You at least #2-- or maybe both to take advantage of the DM780
PSK program in Ham Radio Deluxe.

As Bill wrote, no, you do not need the CAT cable for that. (In fact, you can do both of those digital modes via speaker and mike! It's not pretty, but I've done it.) No, you need only some sort of interface. I use the RIGblaster Data Port Plug & Play from West Mountain Radio, which meets my needs on the computer end because I have a laptop with no serial port. One cable on the Plug & Play connects to the FT897's data jack. The other three cables connect to the computer's mike and speaker jacks and to one of its USB ports.

Thanks Bill. You may be interested in the SGC couplers. I am able
to tune and work even 160m on my longwire in a very confined and
noisy space. The screwdriver idea is more for its' physical size and
ability to move it easily.

As Bill W1WAB said, you'll need a sound card interface to get on the digi modes. There are several excellent commercial models, but it is also a very easy homebrew project. In the Files section look for the folder named something like "Isolated interface". This has a schematic showing how to hook up the computer and rig using nothing more than 2 audio transformers. The radio uses the same connector as a computer mouse or keyboard, so it is easy to get prewired cables for the radio end. Most junkboxes have an old mouse hanging around or a PS2 extension cable works great.

For the modes you mentioned (PSK and SSTV) you can use the radio's digital VOX settings and not have to worry about wiring up the other circuit that would key the PTT on the radio. There ARE advantages to the PTT, such as not transmitting your computer's system beeps, but it is not ESSENTIAL. For CW it is. That circuit is only 3 or 4 components if you go the simplest routes and goes together easily, but it hooks to a serial port which is becoming less common on laptops and even desktops as USB ports take over.

One of my friends uses a cw keyer circuit that is triggered by soundcard audio. There was an article in January 2007's QST by KF3AD describing a circuit like my friend uses. Looking at the QST article it looks very similar to the com port circuits with an audio transformer added to the soundcard end and a relay added to the radio end. The PSK setup I've homebrewed already has that audio transformer in place, right? For Field Day usage I'm thinking of adding in a switch that would enable an audio driven keyer circuit to the PTT for CW usage. That way no matter what computers we have at the Field Day site I'll be able to use it on PSK with digi-vox and on CW as well.

The problem is the term "small" is relative. In the open country a small back yard is less then an acre. In a larger city or a rental complex a small back yard could be a 20' by 10' fenced in concrete slab with a lot of restrictions and a landlord looking for a reason to slap you with a fine.

Personally I have a 40' by 20' fenced in mulched back yard with a small concrete patio, when someone tells me to "just find a tree" I can't help but laugh as the only ones around are in pots on the patio.... I doubt a wire antenna 3' off the ground and 4' long would do much good. Anything outside that fence is off limits even if there was something there as the antenna would pass over neighbor's houses. I also am considering a screwdriver or other vertical antenna I plan to mount on a camera tripod so I can take it down when not in use.

Dave:
Yes, some noise is vertically polarized, but there's also horizontally polarized noise sources such as nearby power lines. Ground wave noise from a distance tends to be vertically polarized (particularly local lightning), but noise reflected off the ionosphere can be random. Also note that noise coupled into the feed-line (common mode) can be a problem so it helps to minimize that with antenna design or decoupling.
So, it's a mixed bag. Good antenna selection for the intended use and careful placement to avoid local noise sources is probably the best way to approach the problem.

In the example noted below, one good solution would be a "Buddipole" type of system. You can see the actual Buddipole at http://www.buddipole.com/index.html It wouldn't work that well for mobile installations, but it's ideal for temporary, or semi-permanent applications.

TO all:

This is one the most rediculous thread I have ever seen. If you are running 100watts, why not use
a screwdriver as a base antenna? I lived in an apartment, and made contacts regularly from 5 watts(FT817) and an MP1 antenna. Surely a person running 100 watts into a screwdriver and counterpoise could do better! People do this in mobiles all of the time.

"Find a tree?"

HUH. Not every one lives in a place with trees or a place to put up an antenna. With all of the discussion on antenna restrictions, you would think everyone would know this.

If you find an antenna that works, use it, and do not let these "father knows best" folks talk you out of it. You can do a lot worse that a screwdriver for a station.

Brian,

Just curious.are they any laws or regulations preventing you from putting up a pole for a wire or small VHF/UHF yagis?

I have a 40 x 100 lot and my back yard is similar in size to your, but I have all sorts of supports in the yard holding up wires and yagis.

Good luck!

73,

Gordon Beattie, W2TTT

Subject: [FT897] Re: 897 and screwdriver ant

The problem is the term "small" is relative. In the open country a small back yard is less then an acre. In a larger city or a rental complex a small back yard could be a 20' by 10' fenced in concrete slab with a lot of restrictions and a landlord looking for a reason to slap you with a fine.

Personally I have a 40' by 20' fenced in mulched back yard with a small concrete patio, when someone tells me to "just find a tree" I can't help but laugh as the only ones around are in pots on the patio.... I doubt a wire antenna 3' off the ground and 4' long would do much good. Anything outside that fence is off limits even if there was something there as the antenna would pass over neighbor's houses. I also am considering a screwdriver or other vertical antenna I plan to mount on a camera tripod so I can take it down when not in use.

I agree!

In the last two Field Days, I used an FT-897D with a ATAS-120 with
fifteen 13-foot radials in a farmer's field AT GROUND LEVEL (
http://web.ae7q.net/doc/public/ATAS-120.html). The bands are pretty
busy on Field day, and I was able to work across the country IN THE DAY
on 40m, 20m, & 15m.

You might take a look at the Buddipole. I've been using one for about 2 years now with great success particularly when out camping portable. Along with a friend we have used them in both the vertical Buddistick mode and in variety of horizontal configurations. They will also be at Dayton.

Amazingly there is nothing in my lease against antennas... it mentions satellite dishes and has strict rules on them, but nothing else. But I have lived in places with similar or smaller yards that did state "no antennas".

Currently I have 2 10 foot poles in the back corners of the fence, and what started as a 40' wire now is a loop that goes from those 2 corners to the 2 corners of the townhouse. It works, but it's nearness in relation to the aluminum roof is causing some issues I believe.

Oh I am also considering the buddipoles someone else mentioned, but I tend to hop bands a lot and prefer not to have to constantly go outside to make adjustments.

In point of fact, if you build a cable that has the DATA DIN connector
at one end, and the small stereo jacks at the other, for the audio
in/out for the DATA connector, that is all you need. This is true of
most or all Yaesu radios.

After reading through some related posts here on the group it looks as though I'm sending my 897D to Yaesu.

Tx on 2m SSB was working FB. Upon the next TX nothing, showing >1 watt on FT meter (movement barely noticable on meter).
Output on 70cm >1watt
Hf-6m >25 watt.

All antennas matched maticulously so under the assumption the fault did not originate from tx into bad impedence match.

Sorely depressed now, HIHI. Have to remove FT 857 from mobile and bring in the house.

Can anyone that had the same or closely related problem that was as I, not covered under warranty, give a idea of the charge by Yaesu. I realize evry radio will not have the same exact problem but just a rough idea will help on the price.

Thanks,
Winston-kg4yus

Well, I had some of the same problems with my "brand new" out of the box 897D. After sending it in to Yaesu (for repair under warranty) I was told the unit needed 2 FETs and another module. It took so long to get the repair turn around, they sent me a new one. So, you may find they have to replace at least 3 parts. Good luck.

HELLO !! If you check the mods files you will find
that the FET's Q1001 and Q1002 (drivers) do fail - I
am assuming that Yeasu let some units go out with the
idling bias setting too low thus leaving them
suseptable to over voltage damage ..... l will not
connect mine to any supply that will supply over 13
volts (MOST AUTOMOBILES RUN 14 TO 14.6V !) untill I
complete the above referenced 10 v regulator
modifications for these FET drivers .... I recommend
that you consult the service manual for proper bias
setting procedure as well as the look at the '897
users group files' and bias the above mentioned FET'S
to be biased a bit hotter as per the 'files' .....
The smaller increase in idling current will allow the
series R 'infront' of these FET's to keep the voltage
lower (to a more safer range ??) .....

Brian,

I would stick to things that you can tune from your shack.

Screwdrivers, perhaps mounted on a pole fed from the bottom might be nice as are wires with tuners like AH-3/4s, or simple dipoles and a conventional tuner should do the trick.

Buddipoles are fine antennas, but who wants to go running in and out to make changes when home if you can avoid it?

Thanks and 73,

Gordon Beattie, W2TTT

Winston~~

Same thing happened to me with old 897 non-D model. Bad duplexer
let some RF into HF SO-239.

Sent to Yaesu California for repair. Took 2 weeks, About $300.
But, they upgraded the firmware and made full tune up too.
Back in shack for a year-- no probs now.

Sorry,
Bill W1WAB

What is your noise level with an antenna installed? I get noise simply through a piece of coax but it all goes away when I connect the antenna. Also, with band conditions as they are, S5 may be a good thing. :>)

Deryck:
You should NOT get S5 signal level with the antenna disconnected. Make sure your RF gain is not turned down at all or it may cause the S-Meter to read higher than 0.

I have had about 10 years of experience with screwdrivers antennas, but only mobile. I think they are the best all round antenna for mobile use. The frequency range and ease of use are excellent. I have used them with IC706MKII and IC7000. I have also used several other types of HF mobile antennas and always come back to the screwdriver. I currently own a Tarheel Stubby 75 and an Electraslide as backup. I have worked the world from my Ford pickups using screwdrivers barefoot. I think if one must compromise on an antenna that is both small and effective in a base station than a screwdriver should work fairly well. Let's face it, most of us must compromise on antenna installations I would love to have a tri-bander up. I have seen yagis that are bigger than my yard. hi hi.

I use the Yaesu ATAS-120 antenna with my FT-897D. While this antenna is typically for mobile use, I use it at home. I have the antenna mounted to a tripod and have eight counterpoise wires of 3 meters or so in length.

The ATAS-120 is rated from 7 MHz - 440 MHz. I've only used it on HF. It performs quite well for me on 20m, 17m, and 15m. I have not had success with it on 40m; however, I only purchased the antenna a little while ago and have not had the time to fully experiment with it. I should be able to get it to work on 40m by increasing the length of my counterpoise wires.

A major advantage of the ATAS-120 over other screwdriver antennas is that Yaesu radios can automatically tune the antenna. You don't need a separate antenna tuner.

Here is a link to many reviews of the ATAS-120:

I live on a lot with a 20 x 40 backyard yard and restrictions wich do not allow any antennas. I use an inverted V which is up only when I play radio.

I put some eye-bolts into the fence on either side of the yard (40 ft apart) and fasten a dipole with bungee cords to the eye-bolts. To raise the center I have a concrete block in which I support a 15 ft long piece of 1 inch diameter PVC pipe. This pushes up the center of the dipole.

So, the ends of this inverted V are about 5 ft off the ground with the center at 15 ft. height. I feed it with TV twin lead and a balun via coax to a tuner. This works surprisingly well, tunes all bands from 80m to 6m and takes me about 2 minutes to set up or take down.

Just my 2 cents worth.

Bob,

While more radials may indeed help, I would suggest you try and get the antenna up a bit higher if you want to work 40 meters. How tall is your tripod? I'm guessing at 5 or 6 feet. If so, you probably have significant ground losses on 40. Can you get it up maybe 12 or 15 feet, or even a bit higher than that? The "magic" number seems to be 1/10th wavelength or so before ground losses start to significantly reduce. For 40 meters that would mean at least 12 feet or so. By all means, add more radials if you can--the more the better. But the higher you go, the less important adding more radials becomes. I know it's a pain to go higher, but maybe you can devise a system that where you can get the antenna up higher but lower it easy enough when you want to use it for mobile or something else. Adding more radials is never the wrong thing to try, but at a low height it really takes a bunch of them to counteract ground losses.

18561. A Crazy Idea For Screwdriver Antennas

Yahoo group: FT897 (2007)
Date: 2007-04-20 18:09:38 UTC
From: n5kwb
Topic: 18561 Message: 18561

Just a thought as I have seen so many postings about using a screwdriver antenna at home. For those that have antenna restrictions and neighbors that don't see the beauty of an antenna installation, put in a small flower bed with a trellis in the center that happens to be concreted in place. Put a small hinge at the bottom of one side with a short pice of pipe or tubing. When you go to opperate, slip a 10' or 12' piece of thin wall tubing in it with the antenna attached. I have used a simular setup on rover operations on vhf. It is not hard to push up with a light antenna. When you get it standing next to the trellis, either tie or clamp it to the side of the trellis and operate. In addition if you can get people to think the mast is part of the flower bed by putting one up on the other side, you could leave all but the antenna up at all times. Still just a crazy idea.

Check and see if it goes away when you turn the computer or the
monitor off. My previous monitor would tear 40 meters up but no
problem with the computer itself. I have a Viewsonic now and ZERO
noise. I don't know how you would check them out in the store but
this one works great.

I am looking at purchasing the ATAS-120 with the base kit and mounting it on a 30 foot tall mast I have next to the house. That puts the base of the antenna 10 feet above the roof line and at 500 feer ASL. I have a seperate ground rod driven into the ground and am using a Tri-Band antenna (diamond VS-2000) with the FT-817 with great results.
As I am still studying for General, I stay on 2/6/70cm but in the very near future will be looking to work HF. Any thoughts on this setup? I too have a small lot and dipoles and Yagis aren't an option...

Thanks!

One thing I did was take all the stock power cords for all my rigs (mobile and portable) and set them up with the 30 amp anderson powerpole connectors.
The power supply in my shack and the two 13.8V Gel Cells I have are also setup in the same manner and I have two cigar ligher plugs with the connectors on them as well. This way I can power any rig from any source. Keeps everything standard and can interoperate with other members of the clud or RACES/ARES

Hi Jim,

I am using a old yaesu fl2100b and use the cat/linear gnd and ptt gnd line into a home brew relay box. I supply the relay with 12v (use any power you want per the relay you have) I leave off the ground and run it through the cat/linear keying line back to the relay in the box. yes it takes external power to run the relay, but by switching through the ground I avoid the nasty voltages that appear on the keying line. Works like a champ. So if your amp uses ground to achieve relay keying of the amp, you may want to consider a similar setup. Hope I have been of some assistance.

Hi Jim,
I use an Ameritron ARB704 universal amplifier interface and connect the 897 to the centurion exactly as shown in the centurion manual for non-tentec transmitters. I got the ARB704 because I really didn't have time to build an interface. Did you buy the centurion new or used? Mine was a demo and runs about 1 hour a day and has done so for the last 2 years.

How were you expecting the filter to improve your rig? There are a variety of filters offered by Yaesu, Inrad, and W4RT. From several posts, it appears that the same bandwidth filter from any two of the companies works equally well, and are well made. Some people want narrower filters than the DSP one to help in crowded conditions, but these make the sound even more "choppier"; some people want wider filters than the DSP one, to make the sound more natural, at the expense of less help during crowded conditions.

I've noticed that many people with older FT-897s believed that the filters were almost required because the DSP one was not sufficient; people with newer ones, after Yaesu's improvements in DSP, seem to feel that the 2.3k one adds very little improvement over the DSP. The add-in filters didn't change, the DSP did. This leads me to believe that the filter isn't crap, but possibly not worth the price for the limited improvement on newer rigs.

There is a good comparison of the effects of some different filters on the signal at the bottom of the page found by the link "TS-570S FT-897D Audio" on http://www.ve6xl.ca .

> How were you expecting the filter to improve your rig?

I was expecting that the filter would tighten things up a bit as to bandwidth of what I was listening to. The ICOM filter of the same flavor helped quite a bit on my ICOM. I like my 897 better than I did my 706MK 2 G.

> I've noticed that many people with older FT-897s believed that the
> filters were almost required because the DSP one was not sufficient;

I have the 897 and NOT the D model.

I can't return it because I didn't discover my mistake for a good month after I bought it. Sure I installed it, and didn't get the chance to test it under some crowded band conditions for over 5 weeks. So much for returning it..... Thanks Randy yours was the most helpful post so far.

How sure are you about the improved DSP? I *was* 99% sure that the only
difference between the 897 and the 897D was the TCXO, different drivers
and a small mod the the speech compressor circuit. Of course with it all
being software these days, I'm sure there have been improvements. If
there have, I wonder if Yaesu would re-program a non-D to make it a D?

18577. AutoTuner for 897 - Recommendations?

Yahoo group: FT897 (2007)
Date: 2007-04-21 22:30:08 UTC
From: Craig Sharrow
Topic: 18577 Message: 18577

I've got a Yaesu FC-30 which I don't use because I need the CAT connection for HamRadioDeluxe.

That wasn't a problem when I only had a Tech License and stayed on 2M, but now that I've got my General ticket I want to PSK31 on 20M and maybe try some other DX.

So here's the question: What auto-tuner do I hook up to my 897 and still be able to use my CAT connection with HRD.

Currently I've got an 80m half-wave dipole with traps for 20M (BTW since installing the traps my PSK31 RX on 20M seems worse - more garbage text on more RXes - that's another problem, but I'll take advice on it too).

Thanks,
Craig

I was told about the LDG Z-11 PRO by another member of this group. I had asked a simular question. I have had it now for about 3 weeks and am well pleased in it. It is maby a quarter of the size of the rig from the front. So far I can't help but recomend it. The price varies from $165.00 and up. Got mine from the Ham Station for $178.00 shipping and all. You may have to shop around as they appear to be selling well.

Tom,
Would you be so kind as to share with the rest of us why you chose the LDG Z-11 pro over the LDG 897?
My FT - 30 is convenient and works well, but I would like to change to a more versatile tuner as well.
Thanks in advance.
Ken - ke7hge

The improvement to which I'm refering came before the "D" model. I don't have direct knowledge; it's what I've gathered reading archives. I found discussions about the DSP changes. I also found postings about the earlier DSP not being very good, but that "later" ones were much improved. I've also read that the 2.3 SSB filter was a must have with the earlier ones, but that it added little to the later ones.

I've seen several references to other changes that Yaesu has made through the years in other areas. For instance, the power FETs were changed before the "D" model, and the FT-857 6M oscellation was addressed. (Some feel that the oscillation is still there; there are references to a different 6M problem due to an incorrect bias level that started recently of which Yaesu is reported to be aware.)

A lot of my reason was recomendation by others who have and are using. From unit itself, I like the idea of being able to achieve an even lower swr by manual tuning if needed. Nothing I could ses on the ldg 897 tuner showed that capability. And finally sometimes it just feels right. You can get a lemon in a Rolls Royce. I didn't and believe that trouble finding one in stock, said something as well. Ask me again in a year and I will know more. For now I will give it a grade A or better. Besides I don't like looking at a bland box with a led on the front. Can't say more than that.

Craig, the LDG "clone" of the 30 will pass the CAT thru and if memory serves it will handle up to about a 10:1 SWR. I've seen some msg's on here that a few guys have had problem with their but that LDG promptly fixed whatever it was. I can vouch for their products I've been using a Z-100 for about 2 years now with nary a hitch. My lone HF antenna is a Carolina Window 80 and prior to upgrading my license I was working HF with Army MARS and it hand no trouble with the non-ham frequencies.

In additon to Tom's comments, I like the Z-11 Pro for it's ability to handle multiple HF antennnas. See this discussion thread on the LDG-auto-tuner Group <http://groups.yahoo.com/group/LDG-auto-tuners/message/2202> The Z-11 Pro does leave the CAT port free - great for running HRD with PSK Deluxe (or now DM780). Don't know what you are using for an interface, but I have had great results with the microHam USB II. The package of FT-897D, Z-11 Pro, HRD, and microHam USB II works FB for me. Of course, YMMV! 73, de AI4LG

18586. FT-897 with TNC, Sound Card Interface and Rig Control

Yahoo group: FT897 (2007)
Date: 2007-04-22 14:10:07 UTC
From: dalite01@bellsouth.net
Topic: 18586 Message: 18586

I am building a portable station in a rack case, similar to what musicians use to transport their electronic gear.

The case is a 6 space high(each "space" is measured as 1.75") 19" rack enclosed in a shock-resistant outer case with removable front and rear covers.

It will house the following:

FT-897D
SCS PTC-IIex Pactor 3 Controller
MFJ 1278M Deluxe Sound Card Interface
InsideOut Networks Edgeport-8 USB to 8 Serial Port Converter
Radio Shack 25 Amp Switching Power Supply
LDG FT Meter
MFJ 941-e Versa Tuner II

Possible expansion may include a FT-8900M Quad-Band, FT-2800 or FT-1500M rig and additional KPC3+ TNC. I have all these items available, as well as a spare FT-100 (not D).

Additionally, I hope to incorporate a float charger and change-over switching to allow operation from a 12v Gel Cell unit.

This outfit is for portable use: field day, training at ham club meetings, emergency use, field deployable auxiliary station, etc...

I will be using a Laptop with MixW, Airmail, MultiPSK, Ham Radio Deluxe, WinPack, UI-View32, etc. communications programs.

I also will have programming software, utility and support software, form templates, etc.

Most of the software for accessing the FT-897 will require data out, and CAT control simultaneously; something that never was a problem with other rigs I have used in the past.

In a perfect world, I would have the PTC-IIex, Sound Card Interface and Cat control to the FT-9897. This would allow Rig Control, Airmail and all Sound Card modes to operate without having to swap cables.

Unfortunately, in Yaesu Land, it appears that using the Sound Card Interface through the Mic jack, and the SCS Controller through the data jack on the rear are the best I can hope for, and rig control is out of the question.

Has anyone found a work-around to allow the FT-897 to be effective in Emergency Communications and portable operation such as what I am attempting? I absolutely do not want to go to a IC-706MKIIg, but would

consider the IC-7000 if they can provide simultaneous Rig Control and Data Port access.

I believe there is a way to use rear connector for data in/out and from Mic jack for CAT. This would allow the SCS Controller to connect to rear data jack, and CAT control from the Mic Jack, but no sound card, and would also require a homebrew interface to allow Mic to be inserted for voice? I will feeding the rig from Ladder Line through the tuner, so the fewer items I have daisy-chained through the Mic jack will lessen the chance of RF coming in on the audio.

I am looking for info, clarifications or corrections to the above. I am going to build the unit anyway, no matter what the outcome is, to get me through this Hurricane season. I can build one that may be a better choice in gear for next year, and pass this one along, but I need to get something functional for the short term.

For the home rig, I use the Kenwood TS-2000, rascal sound card interface, SCS PTC-11ex, ULI VoIP Interface, and W2IHY Audio EQ And Noise Gate with Heil Traveler and Kenwood MC-80 Mic.

I plan on using a Heil Traveler boom headset for the portable setup.

Disregard most of this.

I was confusing lack of ability for autotuner control and rig control with single CAT/TUNER output. I know the LDG tuner will correct this shortcoming...

When I started getting the cables set-up, I found my mistake. I don't know what made me thing that the Data and CAT were on the same jack.

It looks like I will be able to do what I want with what I already have. If I decide to go the autotuner route, it will be via the LDG product.

Sorry for confusion. Another example for RTFM :)

That is an easy answer.MFJ-993B Intellituner. Needs no connection to radio. Works perfectly, LOTS of bells and whistles and unlike the LDG tuners, is NOT confusing to use. A LCD readout to tell you exactly what is happening. Will tune ANY reasonable antenna.

I have had one for some time with my Ft-897D. The first MFJ product I have ever been completely happy with. This Intellituner is going to obsolete the manual tuners as it works and is cheap..

18590. Re: amp connection

Yahoo group: FT897 (2007)
Date: 2007-04-22 18:52:23 UTC
From: ve6xl
Topic: 18563 Message: 18590

Hello Jim,

The FT-897 has two methods I know of:

-Use CAT/Linear Jack (set Menu #20)
-Use ACC Jack and set internal jumper

You may decide to use an amplifier interface depending on the current/voltage of the Amplifier keying circuit. Your Centurion manual should indicate somewhere what that would be. If it is over 12v 250mA I would recommend an interface. I know the Yaesu FT-897 manual indicates the CAT/Linear jack can handle up to 400mA, however looking at the circuit I am not sure I would feel comfortable going that high.

If you plan to use the CAT feature to control the rig via a PC, that leaves you with the ACC jack as your only option on the rig. You can then leave menu #20 set to "CAT". To use the ACC jack you have to open the rigs top cover and move a jumper to activate the T/R relay on the ACC jack. When using the ACC jack the tip is ALC, ring/sleeve is T/R switching.

Some commercial interfaces are found via the links below:

http://www.theheathkitshop.com/_ampkeyer.html
http://www.ameritron.com/products.php?prodid=ARB-704

Hope this helps. I have connected several amplifiers to the FT-897 so drop me a line if I can help further.

Hello Neil,

I agree with Chris (KB2SKP). I also use any 12 battery (currently a 33 amp/hr AGM battery) and utilize Anderson Powerpole connectors.

The Anderson Powerpole connectors when set up correctly are great and have become the defacto standard for ARES and many other groups/clubs when it comes to mobile operation.

18592. FT-897 SSB Filter Comparison

Yahoo group: FT897 (2007)
Date: 2007-04-22 19:16:02 UTC
From: ve6xl
Topic: 18592 Message: 18592

Below is a link to some SSB filter comparison tests for the FT-897.
The tests were added when I installed a second Inrad filter. One quirk
I found is when using two SSB filters the FT-897 assumes they are both
2.3 KHz on the display which can be confusing.

-Stock Yaesu FT-897 Fitler (CFJ455K-14)
-Inrad 2.6 KHz (706F)
-Inrad 1.8 KHz (720F)

You can rename (label) the "FIL1" and "FIL2" filter names using menu #64.

Pat . . .

You have done what we all have done . . . that's life, even in amateur radio.

There is no way to "enhance" a crystal filter. They are sealed units.

In my opinion, the best filters are INRAD and worth the money. Forego a couple of nights-out of food and drinks and order one.

Otherwise, not much you can do except try to peddle it to someone else.

and ptt gnd line into a home brew relay box. I supply the relay with
12v (use any power you want per the relay you have) I leave off the
ground and run it through the cat/linear keying line back to the
relay in the box. yes it takes external power to run the relay, but
by switching through the ground I avoid the nasty voltages that
appear on the keying line. Works like a champ. So if your amp uses
ground to achieve relay keying of the amp, you may want to consider a
similar setup. Hope I have been of some assistance.

18598. Re: AutoTuner for 897 - Recommendations?

Yahoo group: FT897 (2007)
Date: 2007-04-22 21:01:52 UTC
From: Jeff Herhold
Topic: 18577 Message: 18598

I just finished hooking up an LDG 897 autotuner to my 897D, then fired up HRD and PSK31. That combination, once I plugged the cables into the proper jacks (look at the very adequate diagrams, dummy), works very nicely. The configuration couldn't work easier, push the button on front of the tuner and release it; a few seconds the tuner has done its job, tuning my G5RV everywhere I have tried to use it. I can't speak to the other LDG tuners, but know they are also well regarded.

I did have one challenge in getting the CAT to work. I picked up one of those low cost, non-Yaesu versions of the CT-62 USB to CAT cable on EBay from somewhere in the China/Hong Kong area. It arrived without drivers, and WinXP did not recognize it. After popping the case apart and identifying that the chip was by Prolific, their model PL2303HX, finding and installing the proper driver took another 20 minutes, after which it worked perfectly. It coexists just fine with the Dynex USB to Serial converter I have for the PSK31 interface.

Anyone had great success with a noise cancellation gizmo besides the Timewave ANC-4? I have had two of these...one just died....so looking for a replacement.

With all the power line noise, plasma TVs and other RFI generators in the world today, has any company come up with a better, more spectacular solution that uses better technology than the old time design of the Timewave ANC-4?

I forgot to say that you need to jumper the filter so that it does not look like a standard Yaesu 2.3kHz filter (which is how Inrad ships them by default). See message http://groups.yahoo.com/group/FT897/message/11108

My experience has been that, as a general rule of thumb, a ground-mounted vertical with 16 radials is about 3db short of perfect. That's just over half an S-unit. You'll lose a lot more in the loading coil in any loaded short vertical. And phasing two of them properly will get your 3db back, though it won't drop the take-off angle much lower.

For a short antenna, though, it's possible to use just about anything that works. I'm working 75meter and 80 meter nets with a hamstick mounted straight horizontal off my 2nd floor balcony.

18607. Yaesu teck gave me the output spec for FT897D,FC30 and FC40

Yahoo group: FT897 (2007)
Date: 2007-04-24 23:15:00 UTC
From: fzavada7
Topic: 18607 Message: 18607

Hello to the group. Being a new FT897D owner I joined this group to get all the real knowledge of this fine radio. Well living in a CC&R community that does not like antennas, a qustion that I had to ask myself, is what do I do for an antenna. According to Yeasu tek the output power of 100 watts will drive into 12.5 to 150 ohms before the FT897D protective foldback starts to occure. Now you have to remmber that at 1:2 SWR half of the power is comming back into the finals so the net power going to the antenna is 50 watts. As should be immagined at a #;1 SWR it is significantly worse, OK so thats that. Well I think we need a tunner of some kind, seems logical enough OK. Now the output range of the FC30 which seems to be giving people problems is 12.5 ohms to 150 ohms. OK so that is a 3:1 SWR tuned into a 2:1 SWR per Yaesu spec, possiblley better we hope a 1:1. I guess that gives a little protection, not much, but a little. So dum me goes ahead a gets the FC 40 antenna coupler figuring its gotta go something at least 600 ohms or better, after all its meant to tune random wires ie long wires to short wires. WRONG the output is also 12.5 to 150 ohms. Net result unless some one can tell me where I am going wrong, is use a 4:1 balun and go direct to the rig, forget about Yaesu and there turners and should you really want one I would strongly suggest you look at LDG or SGC and then finaly MFJ. Even the worst of the worst would do better than what is currently being offered by Yaesu for this nice little rig. OK I realize I just stepped on a whole bunch of peoples toes here and I mean no disrespect, but the facts being what they are, I really think Yaesu needs a good antenna tunner and coupler designer over there. They have a nice product with a great feature to cost ratio but the tuner/coupler situation really leaves them in a big whole for some of us. My own opinion, does not mean anyone has to agree. PS my spelling leaves somethng to be desired please excuse

Nope! If V is the percentage of reflected voltage:

SWR = (1+V)/(1-V)

and

V = (SWR-1)/(SWR+1)

So with an SWR of 1:2 (2.0), V = 1/3.

Since the reflected power is proportional to the square of the voltage,
the reflected power is 1/9, or 11.1%.

Your right Dean I guess I was having a senior moment here. However the what I would call capture range of both tuners/couplers is still pretty bad FC 30 and FC 40 as they both work with 12.5 to 150 ohm. Putting a balun will help some, but then why buy a tuner or coupler. Again thank you for correcting my mistake on the SWR issue. Frank

I've been using the MFJ 1026. It's not perfect, but it's worked
for me for a long time now, through three different rigs.

Sometimes it's a godsend. Other times the noise is so broadly
distributed that I can't do anything with it.

Good afternoon,

I am new to this group and new to Ham Radio. I had been interested in radio when I was stationed in Bermuda back in the mid 70's. On March 28th I picked up a book on the Technician's exam. On April 1 I took the Technicians exam, on the 14th I took the General exam. With in two weeks I went from no license to General. I am planning on going for the Extra before the end of the year.

For my first radio I purchased a new FT-897D from Texas Towers. Yesterday I made my first contact with my "splash AG". I tried to set up my rig to use a repeater. Following the instructions, I missed the part that says to press the tone key so the word TEN is displayed above and to the left of the display. I am looking for a source of good easy to read and understand information on how to properly use my new radio. There are a few menus I am not sure of how to use correctly.

I have added the FT meter to the radio, it's too bad you can't have two different displays, one for the radio and one for the FT meter. How would I give a signal report? I have the sq/rf knob set for RF gain. I also used the agc while on 20 meters.

18613. Homebrew data cable for PSK

Yahoo group: FT897 (2007)
Date: 2007-04-26 13:05:32 UTC
From: kc0nro
Topic: 18613 Message: 18613

All,
Well, I just ordered the CT62 (CAT Cable) yesterday for interfacing my PC with my 897. Wanna do some rig control.

Then I got to thinking...I would also like to do PSK...and that CT62 won't allow that.

Figuring I have enough spare parts laying around, and checking some threads on this group, I *think* I have it figured out how to build a homebrew cable that will allow PSK operation without an interface...here we go:

For the audio to get from the rig to the PC, plug a regular ol' stereo cable from the headphone jack to the line-in (mic jack) on the PC.

For the audio to get from the PC to the rig, hack an old mouse cable up, figure out what wires go to what pin, then solder on a stero plug (using the pinout for the data jack on the 897) to feed the audio and ground from stero plug to the right pins on the DIN connector.

Set the radio up for VOX, and it should key the radio when Digipan or Hamscope wants to transmit.

Is all of this correct? Has anyone done this and how well does it work? Any pictures or drawings?

Any input is much appreciated!

73 and many thanks in advance,

JOHN
KCØNRO

Yes it will work, I did the same, but use isolation transformers for the audio and data lines. The best is to use the small transformers from old dial up modems. They work very well. I also use the setup for SSTV.

I wasn't planning on wiring up Pins 4 & 5 (RX Data)...only Pin 1 (Data in...audio) and Pin 2 (ground). If doing it this way, would the isolation transformers still be needed?

Many thanks again,

JOHN

I did exactly as you describe and it worked perfectly. IMD reports were
very good on PSK.

Well you want to be able to receive and transmit, so you need both lines. To use it without isol. transformers is very risky and could dammage your 897.

I am somewhat intrigued by all these dire warnings of damage without the use of isolation transformers. Could someone please explain how this damage might occur??.

I can see that there could be some hum loops without transformers, but a damage mechanism eludes me. Both tx & rx singnals to the 897 are single ended, with one side to ground. In most shacks both the radio and computer will be commected to the same electrical ground so I see no problem there. As for the signal side there seems little oportunity for any high levels that will cause damage, and even if there were, they would go strigth through any transformer, as would any spikes. What am I missing?

Meaning no disrespect to anyone, you aren't missing anything. As you say, it is only audio, and a straight-through cable connection from the rig to the sound card is fine. I've done it on 4 or 5 different Yaesu radios with uniformly fine results.

Voltage spikes and ground loop effects could bring destruction to the input of your radio and/or computer as the case might be. Also there is a very good chance of RF pickup in the cables. All together I would not risk it. I fitted the transformers and a decoupling network on a small piece of veroboard. Also I added a small tab potentiometer on the input to the transceiver side. This way I can adjust it for the correct input level to the 897. The input level is fairly critical for proper operations. I use very small ferrite chokes and .001 capacitors on the input and output side. This seems to work ok. The finished project is fitted into a very small plastic box. Anyway its your radio and you do what you think is best.

Whilst I agree that there could be hum loops, I cannot see how they could cause any destructive effects. The ground of both the computer and the radio will be connected together and could only vary my milli-volts. As for spikes they will travel through the isolation transformer just like any other signal, so you have no added protection from them. RF pickup is just as likely with or without a transformer unless you add screening and components to supress it. In fact, unless well screened, the transformers and pcb are more likely to pick up rf than a simple screened cable particularly at LF.

Using transformers is the best route to go for the elimination of hum loops, BUT I cannot see how trying without will cause any harm to the radio.

Well, hum loops are a possibility, but the major problem is the
possibility of a power line loop. In a well ordered world, the
supply earth is at zero volts and all earths are at the same
potential, but pratically this is not so. Supply earths on the
same wall socket are likely to be the same, but different sockets
in the same room? Sockets in different buildings?

If you look at an 10base2 ethernet card (BNC type) you will find
that the BNC outer is isolated from the earth as is a UTP card.
Just for completeness, the 10base5 connector is not, the isolation
is in the tap assembly.

Many amateurs forsake the mains earth on their radio for a good RF
earth, but not on their PC. If there is a differential potential
between the two, it is likely to damage the circuitry in the
radio. It is less likely to damage the circuitry in the sound
card, purely because the sound card is much cheaper.

If you are on a PME supply system, then there are other nuch more
serious issues to address as well.

Hello Bill,

The HRD Bandscope does not work on the FT-897 as the signal meter does not engage while the rig is tuning. I also have a Kenwood TS-570 and the HRD bandscope works on that rig.

Keep in mind the FT-897 comes with its own limited bandscope.

I still use HRD for the FT-897 because of all the other awesome features.

The AGC should almost always be on (unless you're doing noise
figure tests).

The TEN indication means "tone enabled." Basically it means that
you will transmit the tone that's been set for this repeater.

You need to get the rig all set up before you memorize a
repeater. First, dial in the frequency. I usually lock the dial

at this point to avoid problems. Then, set the repeater offset by going to the menu that has RPT and REV on it (I forget what's last). Finally, switch to the TONE menu and push and HOLD the A button until you see the tone frequency. Then dial in the correct tone for the repeater. Press and hold the function button, then check to see if the repeat offset is still on (usually + for above 147 and - for below). You can now test the repeater. If it works correctly select the MW menu and memorize it in a blank memory. It's been a bit over a week, but I have a whole lot of them in mine now, as well as a couple of favorite HF frequencies.

Don't be afraid to read the more detailed descriptions in the manual.

Hi,

I use HRD all the time. Have been using it for several years now. Bandscope? I am not sure what you mean by the bandscope. The frequency displays fine. I don't know of anyway to view the band scope from HRD.

Elaborate a bit on what you mean.

Lloyd, the HRD bandscope worked fine with my FT-897D until I upgraded to Build 1450, I then had the blinking screen and the Bandscope no longer worked. I then upgraded to build 1451, that fixed the blinking screen, but the Bandscope still will not work.

Bandscope scans the band and displays a graph of the activity
found.

It's an accessory in HRD.

Yes, I use HRD and I think I know what you're talking about. I have tried using the band scope with an 897, 857, 817 and an older FT840. With the 840 it works great. As it scans it will show the signal peaks as it passes by stations on the graph. However on the 3 newer radios it seems choppy and no matter how stong of signal it passes by the graph does nothing. I've tried all the different baud rates with no difference. I've also tried different computers and again no joy. I too would like to know what's going on.

18634. CT-62 to USB port on laptop without serial port?

Yahoo group: FT897 (2007)
Date: 2007-04-25 18:49:19 UTC
From: w6rq
Topic: 18634 Message: 18634

Hi Guys,

I've got a SignaLink USB which works great, and I want to add rig control using the CT-62 cable from my laptop to the CAT port on the rig. Problem is, my laptop doesn't have an RS-232 port -- only USB ports. Any suggestions? Is there a CT-62 like cable that has a USB connection, or would a serial-to-USB adapter work with the CT-62 cable?

Many thanks. 73, Curt W6RQ

I've had great results with the Port Authority 2 USB
adapter based on the Prolific chip set and driver
working with the CT-62 cable. I've used it with lots
of serial devices all with great results.

I use HRD, built 1451, with the new DM 780 program (replacement for PSK31) and a FT897. Bandscope, which I seldom use, works as it should do, as far as I can judge. If you like it I can send you a screenshot.

Karel, PA3AKF.

Mike, yours sounds like it's the same a mine is doing. Yes Choppy a
best is a good work for it. But before I upgraded to build 1450 and
above it work great.

Karel, please do send a screenshot of your bandscope in action, it
would be interesting to see with you using version 1451.

Thanks for jumping in there, over on the HRD forum no one seems to be
using a FT-897 as I get no replys to the problem over there.

Hi Dave,

Yes I have done what you mentioned. A friend who has the 857 and I got in touch via the phone. He helped me set up the repeater. I am always reading the manual. Each day I learn something new, I've been into the manual on a daily basis. I am making progress. 20m has been working nicely over the past week.

BIll,

Please send me an email to my address in the header. I will reply
with a screenshot as an attachment. For reasons I don't know I can't
reply in this group with an attachment lik I can in the HRD forums.
BTW: according to HRD statistics there are 2308 users of HRD with a
FT897 (D), that's about 7 % of the HRD-users.

18642. 897D Runaway Power Amplifier on HF/6

Yahoo group: FT897 (2007)
Date: 2007-04-30 19:46:42 UTC
From: Rob, WB1AEX
Topic: 18642 Message: 18642

After 2 years of 100% stable operation, I turned on my 897D and went to join the group on 75 meters and watched as the ALC indicator ramped up and then went all the way to the right within a second or two of keying the mic. Switching to the dummy load, I observed the same behavior, ALC, PWR, SWR and MOD pegged all the right each time I keyed up the rig. The same behavior showed up on all bands from 160 meters to 6 meters. Curiously, even when loaded into a 50 ohm dummy load, it would runaway and indicate a very high SWR. I can only imagine the stress this was putting on the bandpass filters and the PA deck. The DC current indicator on my bench supply showed slightly more than 24 amps being drawn for each brief key down time.

It had been pretty close to a year since I had opened up the rig, so I pulled the top and bottom covers and started checking all the board connectors and all the frame screws. As I suspected, all the machine screws were sitting in their holes, loose as can be. Some of the through-the-board ground screws needed a full 3/4 turn before they were snug. The 4 machine screws that hold down the power transistors needed more than 1/2 turn each before they were secure again.

I also disconnected and reconnected each of the board-to-board connectors to make sure they were fully seated.

After putting the rig back together, all was well again. It is very surprising to me how the thermal effects back those screws out of their holes. A year ago, after checking the idling current, I had gone around and snugged them up. In fact, when I first purchased the rig, I checked and found several of the machine screws were fairly loose and needed attention.

So... if you have never checked them, you might want to give the inside of your 897/857 a once over with a good philips head screwdriver. It could save you from a runaway rig and possible damage to the components.

Does anyone know of any reason why pressure-type lock washers should not be used in the rig? Seems like it would probably keep things locked down for a longer period of time.

73,

Rob WB1AEX

I use a Dentron MLA-2500 with my 897D. I also have a LDG RCA-14 that gives me easy access to all the Cat and Data outputs (well worth the investment). The Dentron only requires grounding out a connection to key, so I use outputs 2 and 3 on the RCA-14. On the Cat output, this translates the same to pin 2 and 3 (TX Ground and Ground)

18649. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2007)
Date: 2007-05-01 11:36:40 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 18649

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

Sure is. But, I recommend you just start operating it. In all modes you can! I'll bet there are at least a few hams in your area that also know lots about that 897. So, they may come in handy to "pick their brains" over some issues.If you can afford it, try and get a good tuner. But experiment with long wire antennas if you have the room. You would be surprised at what you can do with a roll of wire.Just remember the frequency to wavelength conversion and you'll have antennas cut for all the bands soon enough.

Good luck and enjoy the ride.

Dave
Read the manual through twice. Be sure to understand how to program frequencies into the memories. I use these for repeaters on vhf and uhf, call frequencies (such as 50.125 mhz & 144.200 mhz.), often used hf net frequencies and others that others that I may not want to hunt through the bands finding (such as psk 31 or other digital frequencies.

I believe you need to learn how to quickly find and adjust power level, mic gain and compression, keyer speed and delay and vox adjustments if needed. I generallly use about 3 to 5 menu items and work the rest from the front panel. Get comfortable with the rig and you will learn quickly where to go for the common things you need. for the rest well the manual and the group will still be there.

Dave- Congrats, I think you'll come to love the 897. Here's one tip learned from sad experience.

1. Go to the files section of this site and download the Excel spreadsheet of the complete menu.
2. Add a column for "My settings"
3. As your configuration evolves with learning and usage, record your settings so you always have the latest configuration - change a menu setting, change the file.
4. And of course, SAVE the file after any changes.

The 897 menu has 91 items. While most of mine are still in the default setting, many have been set for my preferences. In the event that you ever need to do a full CPU master reset, ("When all else fails - reboot") having this file takes much of the pain out of the process.

Dave

Do not be afraid to ask for help or call tech support if you have an issue.
One of the biggest problems I see is people trying to operate this radio
like a Kenwood. This radio is very menu driven, and the computer operates
the radio. Keep your operations simple at first and do not attempt to do too
many things at once.

I know this advice sounds useless, but most people who hate this radio refuse
to read the manual, or ask for help. These people get frustrated, and sell it.
As experienced I am with Yaesu Style radios, I even had to call tech support
a few times to figure out how to do something that was not clear in the manual.

Once you get over the learning curve, the world of possibilities will open wide!

Catch you on the air!

The most important thing that the manual does not explain well (and there are MANY such things) is that first you have to go to Menu Item 1, Extended Menu, and turn it ON.

>Tom NH2BV,
The antennas here are all broad band..Either log periodics, conical dipoles or conical inverted L's that cover the entire band. Even 160 and 80 meters. So no need for any tuners anymore. I contest quite a bit and didn't need to tune more knobs. Now it's only the linear that needs to be retuned when I change bands.

Started operating last night and did all the easy things with the radio. Actually i found that the menu system is pretty easy to learn, really easier than the 706 mk2 G, I traded in for this rig.

Thanks for the info, cu on the bands.

Dave W1CTN
> Sure is. But, I recommend you just start operating it. In all modes you can! I'll bet there are at least a few hams in your area that also know lots about that 897. So, they may come in handy to "pick their brains" over some issues.If you can afford it, try and get a good tuner. But experiment with long wire antennas if you have the room. You would be surprised at what you can do with a roll of wire.Just remember the frequency to wavelength conversion and you'll have antennas cut for all the bands soon enough.

18657. Yaesu FT897 vs Kenwood TS 570 as a fixed station.

Yahoo group: FT897 (2007)
Date: 2007-05-03 16:56:26 UTC
From: on1vk
Topic: 18657 Message: 18657

Any recommendations ? I have a TS 570 on my desk and a Yaesu 857 in my
car.
I consider to swap the Kenwood with a Yaesu 897 with an LDG AT897 tuner.

Season : size of the Yaesu and the performance of the 857.
Does the 897 match the Kenwood, or should I keep the Kenwood ?

Regards,

Karel

That is a great hint. Thank you.

I also wanted to say that I am now the owner of both the 897 (portable/base operation) and the 857 (mobile). The decision to purchase the 857 over other mobile radios came down to cost and ease of use. Since I already knew how to the use the 897 using the 857 is just learning the locations of the buttons. So far I have been very happy with the 857. Now all I need is another crystal filter and an external speaker. Does the buying ever stop? :)

Dave- Congrats, I think you'll come to love the 897. Here's one tip learned from sad experience.

1. Go to the files section of this site and download the Excel spreadsheet of the complete menu.
2. Add a column for "My settings"
3. As your configuration evolves with learning and usage, record your settings so you always have the latest configuration - change a menu setting, change the file.
4. And of course, SAVE the file after any changes.

The 897 menu has 91 items. While most of mine are still in the default setting, many have been set for my preferences. In the event that you ever need to do a full CPU master reset, ("When all else fails - reboot") having this file takes much of the pain out of the process.

I don't know much about the Kenwood, but for the tuner you might
compare the LDG 897 tuner with the LDG AT-100 tuner. To me the AT-
100 offers more.

There is a guy on ebay who sells datacharts for lots of radios. I'm really glad I got it. It is a ton easier looking at a two page cheat sheet than digging through the manual to figure something out. (Though you definitely must read the manual first!)

I got the 11x17 printed front and back and laminated. I WISH I had gotten 8.5x11 with both sides facing one way. The writing is smaller, but I would have had a nice desktop cover without having to flip it over.

Good luck.

If I already had a TS570, then I would not need to buy the 897. Especially
if I had the TS-570S(Six Meter Model). Then only thing you would REALLY gain
2-meters and 70cm band all mode. If you do not require all modes on those bands,
you could just buy a good dual band FM radio. Also consider if you do not need
the portability, you could buy another 857.

As far as tuners go, You could do a lot better for the price than the AT897
for the price.

Frankly, even though I am more of a Yaesu fan, I could go either way. The only
real gain in my opinion is portability and the extra bands.

Hi,
I believe I answered this in a previous post. I use an ameritron ARB-704 amplifier to transceiver interface because I didn't have the time to build my own. I run it with a tentec centurion and an ameritron 811H. Get the cable for the 897(pnp-8m) and hook it up as per the amplifier manufacturer instructions. Works just fine.

Karel
The question to ask is, "Are you satisfied with the Kenwood?" If so
then keep it. I know nothing about the 570 so can not help there. I
do know that the 897 serves my needs. There may be better radios but
I am very satisfied. I don't need the latest, greatest or newest
rig. So far I could not ask for better performace.

The 570 is a better base radio...Better audio, tuner, functions are
available on the front of the radio...I have both but the 897 has
features of its own for a different type of radio experience...

Apparently the FT 897D does not transmit below 430 MHz. as it comes
from the factory. Mine doesn't anyway.
I was told that was because of the land mobile sharing of that band
above Line A in the US and other uses of those freqs in other countries.

From: ka5y
Topic: 18668 Message: 18668

I'm trying to get the Microkeyer and FT-897 to play with my Dell laptop. I using DX4WIN logger and went through the setup guide for Dx4WIN. The rig control works, Winkey works and I'm able to copy PSK31 and RTTY with MMTTY but I'm not able to transmit PSK or RTTY. The rig goes into transmit mode, the PTT lights up red on the microkeyer but no power out of rig. I've tried USB, LSB, Dig modes with nothing. The rig will transmit in Packet when keyed by the microkeyer. The laptop is a Dell running XP Pro. I've noticed my audio from the speakers is all the down when going to another app?? I think the problem is some kind of sound card issue but its beyond me??? Anyone running similar???

Check Ebay, there are a lot of USB based control cables for sale at reasonable prices. Nobody has rs-232 ports anymore, the USB device will appear to Windows as a com port and you just tell your software which port that is.

From: martin_ehrenfried
Topic: 18671 Message: 18671

Hi All,

Does anyone know where in the UK I can source a DC power connector from ?

I want to make my own power lead but I can't identify the maker of the connector. It looks similar to a standard Molex part but I'm not 100% certain.

Failing that who sells ready made DC leads at a reasonable price, do any UK dealers stock them? I've seen some on e-bay but the in-line fuses don't seem to be blade type required to pass 20A current draw without melting.

Regards,

Martin

18673. Transmit power acting strange on 6 meters

Yahoo group: FT897 (2007)
Date: 2007-04-30 16:44:34 UTC
From: kf4uga
Topic: 18673 Message: 18673

I have used my 897 for only frequencies 6 meters and above for the last 2 years with no problems until now. The problem is at low wattage transmit on 6 meter FM (50.600) between 5-20 watts the rf output on the meter shows it jumping up to almost 75 watts and there is no HSVR warning or reading that shows any SWR problems. When I turn the rig back up to 50 or 100 watts it acts as if nothing is wrong. I am using a Kenwood PS 430 supply to power the rig,(the volt meter on the rig shows normal 13.8 power coming into it. The antenna is a standard Cushcraft 6 meter Ringo and shows no SWR problems. I am curious if this problem is maybe a telling sign of a potential RF final failure or other component failure inside the 897 as all of the external attachments and variables seem to be in good operational order. Thanks in advance to anyone that can lend some assistance on the subject. 73 KF4UGA@... Sam M.

18674. Re: 897D Runaway Power Amplifier on HF/6

From: kf4uga
Topic: 18642 Message: 18674

I have had a similar problem but only on 6M FM.When I set the wattage to 5-20 watts it spikes up to about 75 per the internal metering.The guy on the other end of the QSO tells me that the signal is completely dropping off the air when I am seeing the 897 meter go all twitchy and it reads 75 watts. I wonder if my 897 has a screw loose (and hopefully not the operator) that could be causing the problem. But, mine does not indicate a high SWR or give me the foldback HSVR indicator when it happens.When I roll the power up to 50-100 watts it settles back to normal and gives no strange readings.

Anyone ever had their rig do this? 73's KF4UGA@... Sam M.

--- In FT897@yahoogroups.com, "Rob, WB1AEX" <wb1aex@...> wrote:
>
> After 2 years of 100% stable operation, I turned on my 897D and went to join the group on 75 meters and watched as the ALC indicator ramped up and then went all the way to the right within a second or two of keying the mic. Switching to the dummy load, I observed the same behavior, ALC, PWR, SWR and MOD pegged all the right each time I keyed up the rig. The same behavior showed up on all bands from 160 meters to 6 meters. Curiously, even when loaded into a 50 ohm dummy load, it would runaway and indicate a very high SWR. I can only imagine the stress this was putting on the bandpass filters and the PA deck. The DC current indicator on my bench supply showed slightly more than 24 amps being drawn for each brief key down time.
>
> It had been pretty close to a year since I had opened up the rig, so I pulled the top and bottom covers and started checking all the board connectors and all the frame screws. As I suspected, all the machine screws were sitting in their holes, loose as can be. Some of the through-the-board ground screws needed a full 3/4 turn before they were snug. The 4 machine screws that hold down the power transistors needed more than 1/2 turn each before they were secure again.
>
> I also disconnected and reconnected each of the board-to-board connectors to make sure they were fully seated.
>
> After putting the rig back together, all was well again. It is very surprising to me how the thermal effects back those screws out of their holes. A year ago, after checking the idling current, I had gone around and snugged them up. In fact, when I first purchased the rig, I checked and found several of the machine screws were fairly loose and needed attention.
>
> So... if you have never checked them, you might want to give the

inside of your 897/857 a once over with a good philips head screwdriver. It could save you from a runaway rig and possible damage to the components.
>
> Does anyone know of any reason why pressure-type lock washers should not be used in the rig? Seems like it would probably keep things locked down for a longer period of time.

From: Kevin
Topic: 18679 Message: 18679

Hello All,
I have a question for the group. When I am on 6 meters, no matter what mode, at 50 watts or less the radio will drop out. The party I am talking to reports that my signal drops out completly and my audio stops. I have noticed that there is no change in the swr when this happens but my rf output will show full power. If I unkey and key back up it will work again momentarily. Heat buildup is not an issue here because I can'not stay keyed long enough. Any ideas as to what my problem is? Any help is greatly appreciated.

Unfortunately the DC connector LOOKS LIKE a Molex, but the 'D's
are in a different orientation.

Yaesu dealers seem only to offer complete leads, for whatever
reason, but there is a gentleman from Genrmany who posts here who
I believe is investigating getteing the correct parts from Japan.

18682. RE: [FT897] mars/cap mod for ft897d kb5miq

Yahoo group: FT897 (2007)
Date: 2007-05-06 12:30:19 UTC
From: Ken Bandy
Topic: 18669 Message: 18682

It seems there is some confusion, from what I have read, as to the proper MARS/CAP mods. There are several versions of them floating around. It almost seems as if the mod has changed with the production version of the radio. I too would like to see the "definitive" list of MARS/CAP mods.

Regarding your question of a tuner for the rig. I would advise against the FC-30. I learned the hard way (after I bought one) that it is a fairly limited device. If the mis-match you are working with is more than 3:1, the FC-30 will work on it, and then the rig will come back with a "high-swr" warning and that is that. The LDG tuners, on the other hand will match up to a 10:1 mis-match.

You'll really enjoy the rig. I've got two of them, a "D" version at home with a LDG AT-100Pro tuner, and a "non-D" with LDG AT-897 for portable/EMCOMM.

I have a NTKK LF-C-2A filter mounted on an INRAD SSB PCB
that is 2.7KHz with skirts like a Murata. It came from
Tom WB1FPA.

It is designed to cause the FT-897D TX audio to sound less
"pinched" and RX audio more comfortable under uncrowded
band conditions.

If I can find one that is affordable I will try a 1.8KHz
filter for really packed band conditions -- they sound
awful but really work.

In addition to chronic QA challenges at MFJ their
service and support has been highly uneven in my
experience. LDG has exceptional service and support.

Shame MFJ doesn't offer one for 1KW like the LDG AT-1000.

Right now LDG is the only game in town with an affordable
autotuner that handles an amp.

What would really be neat is a split device where the
control box is at the rig and the tuned circuits outside,
perhaps at the antenna, tower base, or the common ground
panel outside of the building.

Of course a remote antenna switch would also be required.

18689. When would RF damage issue be fixed by Yaesu?

Yahoo group: FT897 (2007)
Date: 2007-04-27 12:38:20 UTC
From: kd4e
Topic: 18688 Message: 18689

There has been some discussion of a final RF stage
vulnerability to damage from a couple of events in
the 857 & 897.

When would Yaesu have started to routinely address
this as an automatic service visit upgrade?

If a rig went to Yaesu service in Dec. 2006 would it
have been addressed or was the problem and solution
only diagnosed in 2007?

I would like to swap ...

My very clean FT-897D for Your equally clean
FT-857D w/YSK857 Remote Kit.

I have the original box, manual, etc.

I would like your 857D to come with either a 1.8KHz
SSB filter, a 500Hz filter, or the cash with which
to buy one (the 897/857 value difference).

I am taking my rig mobile and need small and the
detachable remote-located faceplate.

Doc:
There are several tuners that can do this. The SGC tuners have a remote control box option you can use to re-tune, reset, or bypass the tuner remotely. Of course the weatherproof Yaesu FC-40 can be located at your antenna and controlled right from the FT897. LDG also had an RT-11 tuner that was remote controllable, but I don't think they're selling one like that right now.
No, you should not need a remote antenna switch since most tuners offer a "bypass" mode which effectively switches them out of the line.

I've just been playing tonight with the CFIL and the 2.3 filter settings. Is it me? I can't tell any difference!! :) Both the 2.3 and 500 filters are installed. The 500 makes a huge difference on CW, but the 2.3 doesn't. On USB I can hear a tonal change, but nothing else. On LSB I can't even hear a tonal change. Mind you, LSB sounds very harsh on this radio compared to USB. Is that normal? On other radios there has never been quite that much difference...

Anyway, are the filters set up ok do you think? Presumably so, otherwise they wouldn't show up in the menu. But maybe not...

Any suggestions/comments gratefully received...

tnx & 73

Tom,

I am using the FP-30 power supply that installs right into the rig.
That really is the way to go, if you don't need to share the power
supply with something else. I am still amazed how quickly I can get
on the air when I set up at Field Day or when camping. Plug it in,
hook up the antenna, and start talking.

Good Luck

Hi Nick,

I had a 2.1 KHz wide Collins mechanical filter (one of the newer ones with cylindrical resonators), and I couldn't really tell the difference between the ceramic filter and that one myself, so I removed it for use elsewhere. For me the 500 Hz one does make a good difference as you said.

Wife and I will be there...my first Dayton Hamfest in 15 years...it will be interesting to see how it has changed. Their website says they expect 20,000...seems like 15 years ago it was more like 40,000. Maybe it is the eBay effect. Maybe it is that everything just looks bigger when you're younger!

Looking forward to meeting others from the 897 group.....I will be the pot-bellied ole troll wearing a black cap with "www.AA5FR.com" in gold letters...and a cute little blonde girl beside me. If any of you see us, say hi!

One of the things on the shopping list is a folding solar panel, probably in the 20 watt range, for recharging my motocycle battery that is used to power my FT-857D "Shack in a Bag." If anyone has insights and suggestions for a turnkey solar system, please let me know. Right now, I am considering something like the 26 watt version of the one shown on http://www.powerportstore.com/Solar%20Recharging%20-%20AR.htm

Hello all,

I tried to fix a problem with a non working cat interface and suspected that the on board pico fuse is damaged on the unit . The interface worked fb on my 897/817 but not on my fellow ham's 897. Settings are checked to be ok.

So I disassembled the unit but couldn't find the exact location.

I found a photo on a ressembling case concerning a FT-857 board but the layout of the 897 seemed to be different somehow on that side of the printed circuit.

Is there a photo or some hint on where to locate it?

Tnx in advance es 73 de SV1EEX - Nik

18701. BC station hear in the 30 meter band...Is it my rig?

From: Albeham
Topic: 18701 Message: 18701

Hello all,
I am hearing a BC station , WWCR out of Nashville,TN, loud at 20 over S9 on 10140, almost nightly. Its real frequency is 5070 KHZ. When this station startes to fade out, and the s meter drops, then I lose it on 30 meters. Propagation changes.
I live in MD, where no one else has heard it. Nothing at all.
I have checked my station, all looks good. Grounds are good, no other rig is on, even the PC is turned off when I was looking around the shack for any IF that was mixing. Nothing worked, I still hear it. I have used another antenna system, and it was still there.
I am worried that it is my rig picking it up, somehow, or that it is a known effect.
Could some of you look for this station on 10.140 KHZ aournd 1300 Z. I would like to know if it is my rig, or something to do with the rig.
I would like to know your thoughts. Thank you for your time

Hi Nik,

Please take a look in Files here in the Group > Parts Placement &
Repair > FT-897 ACC Fuse Placement.doc
ACC Jack 3.15 A fuse placement

It is an SMT fuse (a terrible design flaw IMHO). Had mine replaced
with an auto resettable fuse. The above file shows how to replace
wiht a pico fuse.

Al:
Tune up from 1600 in the evening to see if you hear images of other AM broadcast stations and let me know what you find. If so, then you have an overload problem and all bets are off. In my own tests I've identified a weakness at the input of my 897 that behaves like improper biasing of the switching diodes. Preamp off or attenuator in does not affect my problem but small reductions in the input level cause a precipitous drop in the images. It would be interesting to hear what you find.

You're not kidding, about a design flaw! Mine popped when I was doing some voltage measurements. I just put a solder bridge in it's place. No smoke yet.

Hi Nik,

Please take a look in Files here in the Group > Parts Placement & Repair > FT-897 ACC Fuse Placement.doc
ACC Jack 3.15 A fuse placement

It is an SMT fuse (a terrible design flaw IMHO). Had mine replaced with an auto resettable fuse. The above file shows how to replace wiht a pico fuse.

Just a question for some folks about scanning on the 857/897.
I want to scan the Minnesota DNR frequencies with the forest fire situation in our back yard.
I have put both the lower and upper limit frequencies into the radio, when I hit PMS and the arrow is under it, does it just stay on the lower frequency and scan through or should it be moving through the frequencies?

Yep, I hear it hear in the St. Louis area too. I've always heard AM broadcasters on 30 meters when I do NOT have the IPO selected. If I select the IPO (or ATT for that matter), these noises go away.

I've assumed it's some sort of overload/IMD product. Selected the IPO (so it's bracketed), it goes away and does not seem to affect the strength of other signals much.

However, I've noticed that the 897 seems somewhat deaf on 30 meters compared to my 757 - from what I remember. It could be just me and/or 30 is just that much quieter than 40 & 20 (QRN with the former and QRM with the latter)...

Chuck,
Nothing like that. Only this one station is getting to me . Its main freq is 5070, and I also hear it on 10140.
Its the only one, doing this. No AM station, not one at all near me will do this.
Severn,MD, is like 600 miles from NAshville,TN. So I feel it is not a overload issue.

SO can you hear this station from where you live? Does anyone?

AL KA1FFO
Tonight is was s7 s8.

I got my 897D about a month ago did the MARS mod and have been happy as a clam. I have LDG's Z-100 tuner and it works great although it does want to work with the cable so not sure what's up there. I plan to talk with LDG in Dayton in a couple weeks. Anyway the LDG tuners have a better range than the fc-30 approximately 10:1 versus 3:1 for the Yaesu. I run with a Carolina Windom 80 in the trees and have been able to tune everywhere I want to work from 80 up.

I can't hear it well enough on 10140 to tell anything about it, just hear a faint, definitely non-cw signal that sounds like a human voice. On 5070 as I type this there's some kind of religious program.

Hi Al,

What you are hearing sounds like the 2nd harmonic of the base frequency of 5070khz. (5070 x 2 = 10140) Commercial radio stations are to take routine field measurements of there image frequencies so I would not be surprised if it did not dissappear after a few weeks. That is if the station fixes their problem. If you are in MD and the station you are hearing is in TN I'm thinking they have a real problem and during times of propagation it's being spread to distant areas. If the station was local to you then I could see it being there all the time even if the station is within their legal peramters. Here in PA we have a local AM radio station that transmits a base frequency of 1330 khz AM. Their 3rd harmonic is 1330 x 3 = 3990 khz. If a ham station is within 3 miles of the 1330 khz comercial bc station the signal on 3990 khz is s-9 to 20 over s-9! We hold a Sunday morning RACES Net on 3990.5 here in Western PA which at times makes it very difficult to hear the net control. We questioned the stations owners and found that according to their field measurements, they are within tolerances.

Maybe someone with first hand knowledge of what I am talking about would care to comment on this. I am not a radio technician and don't keep up with current FCC requirements of BC stations.

Update on 897D,

After speaking to some girl at Yaesu and not being able to speak
with a tech, and being treated like a sore thumb, I decided to go
another route. I decided to send the radio to Communications
Specialist (hamrepair.com) in Carrolton, Tx.

The radio arrived at the Comm. Specialists last friday and I got a
call from them today. Final output transistor is bad and part cost
is about $70.00 2 hr labor and shipping my radio should be back by
the mmiddle of next week with a charge of @ $160.00

Apparently the HF/6 meter side is fine, I must have been a little
blurry eyed when the other side quite and misread my meter.

U.S. hams are on a shared-basis with other services world-wide on 30 meters. Don't be surprised at anything you might hear, there. And don't QRM them. Just move away to a clear frequency.

Occasionally you will also hear the so-called infamous "numbers stations."

73,

Kent K9ZTV

Can a person tell an embarrassing story on his self on this group?
I have an amateur friend that is a tech at a couple of local stations
near my home - 3 miles distant. On my old Kenwood 680 I would
receive a 3rd harmonic from one of the AM transmitters at about
20/9 here on 80 meters. The tech had just recently started working
there so he fired into the task of trying to eliminate that signal - he
put quite a bit of work into their old station and it probably needed
the attention pretty bad also, He got the signal down to where it was
only barely perceptible at my QTH when they were on there lo power
and about an S5 which was fairly light on there hi power (day and
night settings) - I traded the 680 along about that time for a Mark V
Yaesu and you guessed it - they are gone 100% - A little embarrassing!

Hi Al,

What you are hearing sounds like the 2nd harmonic of the base
frequency of 5070khz. (5070 x 2 = 10140) Commercial radio stations
are to take routine field measurements of there image frequencies so
I would not be surprised if it did not dissappear after a few weeks.
That is if the station fixes their problem. If you are in MD and the
station you are hearing is in TN I'm thinking they have a real
problem and during times of propagation it's being spread to distant
areas. If the station was local to you then I could see it being
there all the time even if the station is within their legal
peramters. Here in PA we have a local AM radio station that
transmits a base frequency of 1330 khz AM. Their 3rd harmonic is
1330 x 3 = 3990 khz. If a ham station is within 3 miles of the 1330
khz comercial bc station the signal on 3990 khz is s-9 to 20 over s-
9! We hold a Sunday morning RACES Net on 3990.5 here in Western PA
which at times makes it very difficult to hear the net control. We
questioned the stations owners and found that according to their
field measurements, they are within tolerances.

Maybe someone with first hand knowledge of what I am talking about
would care to comment on this. I am not a radio technician and don't
keep up with current FCC requirements of BC stations.

Chuck,
Nothing like that. Only this one station is getting to me . Its main freq is 5070, and I also hear it on 10140.
Its the only one, doing this. No AM station, not one at all near me will do this.
Severn,MD, is like 600 miles from NAshville,TN. So I feel it is not a overload issue.

SO can you hear this station from where you live? Does anyone?

AL KA1FFO
Tonight is was s7 s8.

Al:
Tune up from 1600 in the evening to see if you hear images of other AM broadcast stations and let me know what you find. If so, then you have an overload problem and all bets are off. In my own tests I've identified a weakness at the input of my 897 that behaves like improper biasing of the switching diodes. Preamp off or attenuator in does not affect my problem but small reductions in the input level cause a precipitous drop in the images. It would be interesting to hear what you find.

From: Massimo Corinaldesi
Topic: 18724 Message: 18724

Where to find the pinout of the 6 pole battery connector (charger side) ?
I'm not able to find nor in the manuals nor in the internet that
information.
Sure I could use a dear old tester, but would be better to have an
info to compare to.

Hi to everyone who answered my question.

The powerwerx site looks the most promising.

It also gave useful information on high current DC 'Anderson'
connectors. I already had sme as surplus items, but couldn't figure
out how to remove the contacts in order to reuse them.

But I can now !

Great thanks again.

18726. Re: [FT897] FT-897 SSB Filter Comparison

Yahoo group: FT897 (2007)
Date: 2007-05-07 18:54:55 UTC
From: kd4e
Topic: 18592 Message: 18726

Anyone tried a 1.8KHz filter for really rough,
packed band, SSB conditions?

I have used them in other rigs in the past and
found them very effective, though unpleasant to
listen to.

Anyone have a reasonably priced source for one,
new or used?

I have a NTKK LF-C-2A mounted on an INRAD SSB PCB.
It is 2.7KHz with softer skirts. The purpose is
to soften the RX or TX, or both, from the more
harsh sounding stock filter. Great for ragchewing!

I'd like to replace it with a 1.8KHz for SSB and
a 500Hz for digital modes if anyone is interested
in a swap for either.

I have somehow managed to misplace the message I got from another MARS operator and 897 owner who was kind enough to send it to me. I had to bridge either 3 or 4 of the pads and remove two factory jumpers then do a reset. I will eventually remember where I put that message for safe keeping and pass it own if you haven't heard from the other gentlemen. Too much going on and too little time.

I got my 897D about a month ago did the MARS mod and have been happy as a clam. I have LDG's Z-100 tuner and it works great although it does want to work with the cable so not sure what's up there. I plan to talk with LDG in Dayton in a couple weeks. Anyway the LDG tuners have a better range than the fc-30 approximately 10:1 versus 3:1 for the Yaesu. I run with a Carolina Windom 80 in the trees and have been able to tune everywhere I want to work from 80 up.

I cannot hear it in West Missouri on 10.140
but is 20+ on 5.070 - de NØATH

Chuck,
Nothing like that. Only this one station is getting to me . Its main freq is 5070, and I also hear it on 10140.
Its the only one, doing this. No AM station, not one at all near me will do this.
Severn,MD, is like 600 miles from NAshville,TN. So I feel it is not a overload issue.

SO can you hear this station from where you live? Does anyone?

AL KA1FFO
Tonight is was s7 s8.

Al:
Tune up from 1600 in the evening to see if you hear images of other AM broadcast stations and let me know what you find. If so, then you have an overload problem and all bets are off. In my own tests I've identified a weakness at the input of my 897 that behaves like improper biasing of the switching diodes. Preamp off or attenuator in does not affect my problem but small reductions in the input level cause a precipitous drop in the images. It would be interesting to hear what you find.

Well with all this talk going on I thought I will listen on both frequencies. However I could not receive anything on 5070 but on 10140 I could receive s6 to s8 signals. They were in English and appeared to be a religious program. Very hard to say as the QRN was very strong. This was during the early evening hours. Darkness between the US and my location. The QTH here is in Perth Western Australia. I do believe that this station is transmitting a very strong first harmonic signal, otherwise I should not be able to receive it in Perth. 73's Jurgen VK6AHI

Not Quite.
Up until about 1.5 years ago all D models and non D models could be wide banded with software. However the FCC didn't like this so Yaesu were made to change things. All newer D models need a hardware mod.

My understanding is that the "D" models require a hardware mod. The non D'd could be done via software. One of the MARS guys here in Ohio did his non d that way.

Hi Curt - we've got an 857d and I'm wondering....did you use the software or hardware mod - what problems did you have? Any suggestions?

Wally

You said you could not find the pinout in the "manuals". If you ment
the owner's manual it would not be found there. I beleive the pinout
is shown in the schematics that came with your radio. I was looking
for the same thing because I want to use a solar panel for portable
operation.

18739. Ignition/injector noise question.

Yahoo group: FT897 (2007)
Date: 2007-05-12 04:47:36 UTC
From: James Wilson
Topic: 18739 Message: 18739

I have an FT-897 installed in my 2000 Dodge Cummins diesel truck. I have tremendous noise S9 on 20 meters while the truck is idling or at higher RPM's. 20 meters seems to be the peak of the noise bell curve. 80 meters works fine so do the higher freqeuencies like 6 meters.

I have installed Ferrite capacitors on the coax wire running to the antenna with little improvement. What I have noticed is the noise seems to be coming from the antenna itself and not the coax or power. I determined this by disconnecting the coax from the base of the antenna, in this configuration the noise is about s2.

Any idea's on things I can try to reduce the noise while the antenna is connected on 20 meters? I am not looking for a complete elimination but dropping it to a more reasonable level would be great.

Grab a length of coax, connect it to the radio, expose part of the end and inch or so, and use it to go sniffing for the noise source.

When you find the source you can then treat it.

Hi, couple things to try..... First take a look at your NB level in the menu. Set it to the highest number. 2nd, attach a 1 inch wide metal strap to the end of your exhaust pipe and to the frame of the truck. The exhaust and the engine sit or hang from rubber mounts making the exhaust a 20m radiator for noise. A self taping metal screw into a pre-drilled hole will work great. You should probably ground strap the fenders, doors, hood, tailgate and the radio to a good frame ground.
Hope this helps,

Hello Everyone,
I have been racking my brain trying to get this to work. I have been trying to find an APRS program that would work with my soundcard and 897D. I have successfully been able to send/receive PSK-31, but am having a lot of trouble finding a program that will use my soundcard well for APRS.

I have tried UI-View with AGWPE, but to no avail. Any help would be great!

Thanks and 73's,
KD8CCX - Adam

I think it might be the aftermarket fuel pump I will disconnect it tomorrow and see what happens.

Here is an update. I grounded the exhaust to the frame, the hood to the fender (is this good enough?) and the tailgate to the bed.

The only change I noticed was a drop from s9 to s8 when I grounded the exhaust. I obviously have a long ways to go but that's a little progress.

Thank you everyone for your advise.

If it is the fuel pump what's the next step?

Ground the fenders to the frame on all four corners of the truck and ground the bed to the cab (and to the frame). Make sure you also have a strap on the antenna if it is not already grounded to the frame (via bumper?).

A better, low-inductance, heavy copper ground from the ENGINE to the frame/body may be needed. Make this ground from large size, such as #2 gauge or bigger, copper cable and suitable lugs. The cable should be very SHORT, but long enough to allow for normal engine movement in its rubber vibration mounts.-KC3VO

The exhaust can be a good radiator due to its length, though one would hope since it's under the vehicle it's emission to your radio is minimal.

Trouble with grounding the exhaust is that it starts to then become a conductor and rots away an awful lot quicker unless it's stainless.

DC and galvanic corrosion are the big problems, RF in the exhaust will often reduce corrosion.

If you are going to ground it, don't use a braid, but hi temp capacitor. There are MOD exhaust grounding kits where they wrap some sort of plastic insulator around the pipe, and a thick copper sort of pipe clip with a grounding braid. They thus form a capacitor on the exhaust, but I don't know what the plastic is, and it's been years since I have seen any of these kits which Marconi used to make, it looks like nylon, but nylon would melt, it may be a hi temp ptfe sheet.

I also don't know how successful they were but they sold loads of them.

From: Charles Scott
Topic: 18739 Message: 18750

James:
The one best answer you got so far was to go find the source of the noise. Using a short exposed end of the coax is one way to do it, but if you want to be able to get closer to the source use a small coil of several turns tied across the end of the coax. That will be less sensitive to more distant noise and you'll definitely know when you get within an inch or so of either the source or something that's conducting the noise.
The other thing is to consider what the noise sounds like. In your diesel truck you'll have a short list of things that could generate noise. That would be things like the computer, injector controls, electric fuel or lifter pumps, and alternator. (Do you also have a power inverter installed in the truck?) Does the rate of the noise stay the same or does it track with engine speed? Does it have a sharp pulse type sound or is it more of a whine? Thinking about what it sounds like will quickly get you close to the source.
The last thing you want to do is to start grounding and suppressing things without having any idea about the noise source--you could easily waste a bunch of time that way or even make it worse. Once you know the source, you can more effectively deal with the noise. Also, knowing the source of the problem you can look for manufacturer suggested, or perhaps provided, cures.

Thanks Charles.

I am very suspicious of the after market fuel pump.

The noise is constant static, it doesn't have a tune and doesn't vary with engine speed.

Later today I am going to use the coax method of finding the source, I have a coax 2 meter dipole I am going to coil up and drag it around the possible sources.

Let's say it is the fuel pump, can I wrap this in something to reduce the noise? I have looked for lead foil but unable to find any. It's probably against the law to sell to consumers.

Ok, well you've eliminated the injector controls and alternator. If it's the fuel pump, you'll want to put a filter right on the power line to the pump and as close to the pump as possible. You can start by trying clamp-on chokes, but this may not solve the problem.

For most fuel pumps it isn't the motor itself that emits the noise, but conducted emissions on the power leads. As such screening the pump is useless, you just need to filter the supply.

The Ford pumps respond to a cap across the terminals, from what I've been told 100nF to 220nF is about right.

A few turns of through a ferrite bead may also do the job.

From: John
Topic: 18754 Message: 18754

Just a thought here in the UK some on board computers have there case grounded hence why the antena picks it up .The other thing I had once was the on board car alarm system's sensors caused the problem all I did was fit a breaker swithch in line and all was happy again.Sniff it out with coax but it must be something that has a radiating element as it comes in via the antenna .Another test just switch on the ignition with NO engine running and that might help eliminate some problems but do remember that when the ignition is on the sensors are working.
Good luck
I do have a good push bike lol
Might be easier in the long run

220uf-270uf is more like it.
Make sure to use a polarized Electrolytic Capacitor rated for 24v
Connect it from the positive lead to the fuel pump then to chassis
ground not to the ground wire to the pump.

18756. UHF Simplex and repeater offset

Yahoo group: FT897 (2007)
Date: 2007-05-12 03:54:41 UTC
From: Glenn (KC0SHS)
Topic: 18756 Message: 18756

Whenever I try to use UHF simplex freqs, (445.9125 445.9250 445.9375 445.9500....etc...) I have to manually turn off repeater offset. If I touch the tuning knob one small bit, the repeater offset turns back on.

Without defeating auto repeater offset all together, is there a way to defeat auto repeater offset for the UHF simplex freqs just like on the VHF simplex freqs?

Thank You In Advance!

this is WWCR in Nashville TN (www.wwcr.com). S9+30 on 5070kHz in NC.
10140khz is S9. Using FT-897D.
Wonder if their 1st harmonic radiation is within FCC limits?

Well with all this talk going on I thought I will listen on both
frequencies. However I could not receive anything on 5070 but on 10140 I
could receive s6 to s8 signals. They were in English and appeared to be a
religious program. Very hard to say as the QRN was very strong. This was
during the early evening hours. Darkness between the US and my location. The
QTH here is in Perth Western Australia. I do believe that this station is
transmitting a very strong first harmonic signal, otherwise I should not be
able to receive it in Perth.

18758. ldg at 897 tuner for ft 897d

Yahoo group: FT897 (2007)
Date: 2007-05-12 19:24:29 UTC
From: tell ya later
Topic: 18758 Message: 18758

hi all
first i would like to thanks to everyone for the responces to my previous questions, everyone has been real helpfull and i appreciate it.
my next question:
i am trying to use the at 897 tuner by ldg with my rig and is there any settings on the radio itself i need to use when using this tuner? i have used the quick directions that came with the tuner and have read the manual for the rig and nothing is jumping out at me. i am using a hustler 5btv vert groundmounted with radials and a van gorden g5rv dipole and i seem to have a better swr without the tuner at all than i do using the tuner, i also dont see where the tuner is doing anything other than the red led flashing when i press it.
any ideas?
thanks and 73
david
kb5miq
ps when i said without the tuner at all i ment the tuner not even connected to the radio

I hate to be a stick in the mud but you may be battling pulse noise you may never remove from the Yaesu 897. The 857,897 and the Mark V all have noise blankers that are less than stellar. I have a Toyota Corrola 1997 I had this problem and did all of the grounding and what eliminated 90% were ferrite core around spark plug wires. I know a diesel have none but if you can put them on the ingestor wires I would try that but don't be surprised if you never get it all out of the Yaesu line of audio.
Bob WE0Z

Jim <nj3t@...> wrote:

Hi, couple things to try..... First take a look at your NB level
in the menu. Set it to the highest number. 2nd, attach a 1 inch wide
metal strap to the end of your exhaust pipe and to the frame of the
truck. The exhaust and the engine sit or hang from rubber mounts
making the exhaust a 20m radiator for noise. A self taping metal
screw into a pre-drilled hole will work great. You should probably
ground strap the fenders, doors, hood, tailgate and the radio to a
good frame ground.
Hope this helps,

18760. HRD FT-897D BAND SCOPE INFO

Yahoo group: FT897 (2007)
Date: 2007-05-12 06:06:35 UTC
From: James La Follette
Topic: 18760 Message: 18760

Someone posted their problems with the Ham Radio Deluxe band scope when using the FT897D. I also had the same issue , band scope did not work well or the same way it works on my Kenwood. I love HRD and think it is by far the best CAT program that I have tried. I was willing to accept the limitation.

While attempting to solve the problems , I tried a cat speed of 4800bps, slowed the port on the computer etc.

I think I have found the cure. If you place the FT-897D in scan with the scan button on the radio then start HRD band scope scan (with the arrow key)the scope operates in a normal manner (my radio scan setting is Time , 1 sec)

I can only guess that the scan feature in the radio causes the S meter function to behave differently.

This is working well for me. I hope it also works with the FT-897.

18762. "One Big Punch" Speech Processor from W4RT Electronics

Yahoo group: FT897 (2007)
Date: 2007-05-13 00:12:00 UTC
From: k6fsh
Topic: 18762 Message: 18762

I am tempted to buy one of these since it's only $49, user installable and sounds like it could be a worthwhile improvement in transmit sound quality. But then I took another look at my FT-897D user manual and discovered on P.31 that a similar function (controlled by menus: MFc and 74) appears to be built-in. Do any of you have experience with the "One Big Punch" Speech Processor and does it offer anything that is substantially different from the built-in AF Speech Processor described on P.31.

You can see the "One Big Punch" Speech Processor here:
http://www.w4wb.com/index.htm

Thanks for any insight you can offer.

It's easy to check the fuel pump. Listen to your radio before you turn the key on, then just turn it to run position without starting the truck. The fuel pump will run for 2 seconds to prime the system, then stop. If your noise gets bad for 2 seconds and stops, thats it.
W4MAC-Mack

James Wilson <james@...> wrote:
I think it might be the aftermarket fuel pump I will disconnect it tomorrow and see what happens.

Here is an update. I grounded the exhaust to the frame, the hood to the fender (is this good enough?) and the tailgate to the bed.

The only change I noticed was a drop from s9 to s8 when I grounded the exhaust. I obviously have a long ways to go but that's a little progress.

Thank you everyone for your advise.

If it is the fuel pump what's the next step?

Heheh... Yep, a lighter will find the leak for sure! They fired a guy where I work for doing just that in the ceiling over one of the restaurants. They found out he was doing it and stopped him before he found the leak.

Maybe the fuel pump is causing the noise??

Subject: RE: [FT897] Ignition/injector noise question.

Grab a length of coax, connect it to the radio, expose part of the end and
inch or so, and use it to go sniffing for the noise source.

When you find the source you can then treat it.

Subject: [FT897] Ignition/injector noise question.

I have an FT-897 installed in my 2000 Dodge Cummins diesel truck. I
have tremendous noise S9 on 20 meters while the truck is idling or at
higher RPM's. 20 meters seems to be the peak of the noise bell curve.
80 meters works fine so do the higher freqeuencies like 6 meters.

I have installed Ferrite capacitors on the coax wire running to the
antenna with little improvement. What I have noticed is the noise
seems to be coming from the antenna itself and not the coax or power.
I determined this by disconnecting the coax from the base of the
antenna, in this configuration the noise is about s2.

Any idea's on things I can try to reduce the noise while the antenna is
connected on 20 meters? I am not looking for a complete elimination
but dropping it to a more reasonable level would be great.

I'm just curious, has anyone thought of writing them a nicely worded
letter? If they were causing interference to my operations I'd do
that first. They're not interfering much with me, probably because
they're off the end of my dipole in a null. The station might not
even be aware of the strength of thier first harmonic.

18768. RE: [FT897] ldg at 897 tuner for ft 897d

Yahoo group: FT897 (2007)
Date: 2007-05-14 17:20:04 UTC
From: Ken Bandy
Topic: 18758 Message: 18768

Hello David. Just so I am clear, you are saying when you press the button on the AT897 tuner, the only thing that happens is the red led flashes, correct? When you press the button, how long do you hold it? If you only press it for a short period of time (< 1 sec., I believe) you will put the tuner in bypass mode. You do have the tuner connected with the radio like the diagram included with the tuner indicates, correct? Especially the short jumper that has a red 1/8" TRS plug on one end and a black 1/8" TRS plug on the other. If you don't have that one in line, you will need to manually put the rig in AM or CW mode to initiate a tune cycle. If you do have the short 1/8" jumper in place, make sure you have it plugged in correctly, it makes a difference which end is plugged where. Also, there are more than one 1/8" jack on the back of the radio, make sure you are in the right one.

73,
Ken

Subject: [FT897] ldg at 897 tuner for ft 897d

hi all
first i would like to thanks to everyone for the responces to my previous questions, everyone has been real helpfull and i appreciate it.
my next question:
i am trying to use the at 897 tuner by ldg with my rig and is there any settings on the radio itself i need to use when using this tuner? i have used the quick directions that came with the tuner and have read the manual for the rig and nothing is jumping out at me. i am using a hustler 5btv vert groundmounted with radials and a van gorden g5rv dipole and i seem to have a better swr without the tuner at all than i do using the tuner, i also dont see where the tuner is doing anything other than the red led flashing when i press it.
any ideas?
thanks and 73
david
kb5miq
ps when i said without the tuner at all i ment the tuner not even connected to the radio

If anyone has the above config I would like to hear from them.

I hook it up and all I get is the relays making lots of noise (I tune it on the Am band) and the radio shows high SWR. I can listen but not transmit. Do anyone know of a user group for the above.

What am i AM DOING WRONG

Topic: 18701 Message: 18775

Just checked again this evening with my TS-850S and 80m inv. L. 40 over on 5070 and cannot hear even a carrier on 10140. Have the 6m beam hooked up to the HF port on the 87 and they are S7 on 5070 and again, nothing heard on 10140. I am maybe 400 miles from Nashville. Have not tried the Inv.L. on the 857 yet but will try it some time this week.

Actually could be nothing you have done wrong. Check tuner on another radio. If necessary, go to another hams house. If it continues to do so, contact LDG. A lemon is possible in any product. It happens.
Good luck
Tom

I didn't when I installed my AT-897. Menu option 20 is set to "cat", and
menu option 85 is set to "off".

hi all
when seting up the LDG at 897 tuner with the ft 897d do you have to do
the same setup steps detailed on pg 43 of the ft 897d manual? i just
hooked mine up according to the tuner manual and it does not seem to be
working correctly.
thanks and 73

I dunno. If I hook any OTHER speech processor up, it will be my
old Ten Tec external one. That thing is actually a clipper for
SSB. It takes the audio, translates it to 6mhz ssb clips it,
filters it and then translates it back to baseband.

Hi Deryck,

I have the same combo....FT-897D and the LDG AT-200Pro. I have not had the problem you describe but have had a similar problem with my Z-11 Pro when I uses internal batteries and the aggregate voltage drops belower than about 8.2 volts. Ergo, you might check your power supply voltage.

Also, check out and join the LDG Yahoo Group at

http://groups.yahoo.com/group/LDG-auto-tuners/

Good Luck!

From: George
Topic: 18761 Message: 18781

I had recently purchased the AT897 tuner and installed it. It came with a manual and an addendum. It is important to follow the addendum's instructions. The ACC cable has a RED and a BLACK plug and it is important that the correct one is in the radio's ACC jack. When I first installed it I had it as the main manual said and the tune cycle did not work. I reversed it and it worked like a charm.

Make sure your menu settings are as mentioned in someone else's post, and the ACC cable plugged in with the correct "polarity" and it should work fine

Actually, the menu settings have no effect on the AT897. The only reason it has a CAT connection is to power the tuner. In fact, there was an adapter furnished with mine a couple of years ago that would allow for the replacement of the CAT connection with a "wall wart".

The proper installation of the litle 1/8" jumper does matter, as David found out.

How do you have your system set up Adam?
What interface are you using between the radio and the computer? I'm using Buxcomm interfaces.
What programme are you using to demodulate the data?
Which mode are you interested in? PSK, RTTY etc

I think a lot of the time Gary the real need is down to the persons voice.

Some have a voice that has one big punch built in, some not so and some electronics help can benefit them.

Then there are spectral voice processors that work for everyone, very complex processors from the 1980's, but you don't see these in the ham market though the techniques they used could probably be added quite cheaply be achieved with DSP.

18787. Re: "One Big Punch" Speech Processor from W4RT Electronics

Yahoo group: FT897 (2007)
Date: 2007-05-16 11:50:19 UTC
From: Jochen - DG2IAQ
Topic: 18762 Message: 18787

Hi Woody.

To answer your question properly it's first needed to know and understand the FT-897 schematic or at minimum its block diagram.

The key is that the electronic modulation level (AM, FM, SSB as per usermenu settings 0 to 100, 50 by factory each) works AFTER the build-in transistor microphone preamplifier stage.

This means that if you feed in a too high level into the mic socket the resulting audio would content distortions, regardless of what the MIC LEVEL settings are !
E.g. I know from some german users that they use typically CB desktop preamp-microphones (like Sadelta, Densei, Turner) for their FT-857/897. Crazy !! Cause most of these mics only have a build-in additionally pre-amp, but no limitation.

So here's my simple rule: "Shit in = Shit out"... :-))

Now coming back to your questions:

Yes, it could make sense to use the OBP compressor as it really limits your audio INPUT (!) level. You get a wider "mouth-to-mic" working range without the typically significant audiolevel dropdowns of the originally MH-31 (dynamic !!) capsule. So you don't have to "focus" your mic like the cat sits in front of the mousetrap, ...hihi.

The second thing is that you have an input audio level limitation, the typically advantage of a compressor stage. So if the 897-input level is set properly its internal mic-preamp-stage would NOT be overdriven, even if the operators range to the mic front or his loudness in voice chvaries.

Now the disadvantages: (Sorry, but they exist. Hihi.)

I own 2x DYC-817, the nearly similar circuit to the OBP here in Germany or Europe (http://www.box73.com/shop/pdfs/734980.pdf). They use the same audio compressor IC named "SSM2165".

And this one has a fixed build-in noisegate as well. This can be an advantage of course, but also a disadvantage. You don't have any optical feedback if you still talk in the "open-noisegate" range or if the noisegate just cut down your audio. And the originally circuit provokes a "PLOPP" on opening the stage. How strong this effect is depends on the used mike and/or the SSM-2165 input level.

****
It can be minimized, nearly eliminated by soldering a 47k in parallel

to the 0.0033mF (3.3µF) capacitor to ground (needed for the noisegate delay). As the resistor shortens the delay period and would cut your audio fastly the delay cap has to be raised to compensate. 0.0033mF (3.3µF) -> 0.022mF (22µF) up to 0.047mF (47µF).
****

Another possible (!) disadvantage is that a fixed build-in compressor like the OBP can be affected by RFI stray. And I'm 100% sure this will DEFINITELY happen on your next fieldday (Murphys law, ..hahaha..) when you won't have any soldering iron or possibility to remove the compressor.
Once again: This CAN happen, but it MUST NOT BE.

My experience with the FT-857/897 models is:

1)
First replace the dynamic capsule of the MH-31 with an electret capsule (a huge improvement in loudness, RF average power out and intelligibility)

2)
If you really like you can then try a compressor afterwards in addition.

And to answer your last question:

The 897-build-in (so called) "Speechprocessor" is nothing else than a switcheable additional audio amp stage which works on its maximum amplification level and therefor clips the audio peaks. The newer models of the 857/897 (I would say after S/N 4xxxxxx) have a fix in, an additionally 0.000015mF (15nF) capacitor as a simple, passive highpassfilter around 600 Hz. Cause for excessive clipping a reduction of the basses is needed not to distort too much. The old models DON'T have this and their speechprocessor ON/OFF is mostly not recognizeable. Therefore Yaesu did the capacitor fix in the later models.

And the PROC ON works only for AM/SSB, not for FM. Every external audio equipment would work on all modes instead of course.

Coming back to the previous sentence, the overdriven additionally amp stage of course provokes audio distortions. This is the reason why usually a PROC-LEVEL (if I remember menu setting 074 ??) higher than 30 - 40 does not make any sense. Of course the wattmeter readout average seems too be higher, but what you can't see here...the dropdown of the intelligibility is usually much higher, ...hahaha...

Uffff, long posting, but I think everything should be said I hope.

So my final tip is: Just try a simple electret capsule (which even has to be level-reduced by either the bias-resistor or a simple 2-resistor-level-divider-to-ground). You'll get a powerfull, rich and wide CLEAN audio (especially on FM).

If you like to hear the difference between an electret capsule (just a huge improvement) and the DYC-817 and the external, real RF-clipper, just listen to my sample files here:

http://www.jwm.de/afu/minics.htm

Hello Jochen,
Thank you very much for your long reply. It has a lot of good
information.

Just one more question, will the DYC-817 work with an FT-897 or is it
just for the 817??

Thank again,

FiSH K6FSH

Yes I have called and talked with the stations Engineer. This was a few months ago. Nice guy. Still getting the station on 10140 KHz.

I'm just curious, has anyone thought of writing them a nicely worded letter? If they were causing interference to my operations I'd do that first. They're not interfering much with me, probably because they're off the end of my dipole in a null. The station might not even be aware of the strength of thier first harmonic.

Just checked again this evening with my TS-850S and 80m inv. L. 40 over
on 5070 and cannot hear even a carrier on 10140. Have the 6m beam hooked
up to the HF port on the 87 and they are S7 on 5070 and again, nothing
heard on 10140. I am maybe 400 miles from Nashville. Have not tried the
Inv.L. on the 857 yet but will try it some time this week.

this is WWCR in Nashville TN (www.wwcr.com). S9+30 on 5070kHz in NC.
10140khz is S9. Using FT-897D.
Wonder if their 1st harmonic radiation is within FCC limits?

Well with all this talk going on I thought I will listen on both
frequencies. However I could not receive anything on 5070 but on 10140 I
could receive s6 to s8 signals. They were in English and appeared to be a
religious program. Very hard to say as the QRN was very strong. This was
during the early evening hours. Darkness between the US and my location. The
QTH here is in Perth Western Australia. I do believe that this station is
transmitting a very strong first harmonic signal, otherwise I should not be
able to receive it in Perth.

Hi "FiSH",

(haha..crazy name but I'm sure it's a shortage of your real name,
even without the knowledge on looking into QRZ.COM for
details, ..hihi).

YES !!! You can use the DYC-817 for either the FT-817/857/897 rigs
as their input and mic socket layout are exactly the same.

The DYC-817 is the "international version" you can get at
www.box73.com. Here for the german market it's just
called "FUNKAMATEUR KOMPRESSOR". FUNKAMATEUR is a german ham radio
magazine, the "Kompressor" circuit you can get on their webshop. But
for the international market they created a second site, called
box73.com. But the "source behind" is the same.

So the DYC-817 can be used on all 3 rigs. They all provide +5V on
their mic sockets as well (but it's limited to around 10mA only -- as
shown in the usermanual, I think).

But no problem here. Either the DYC-817 as well as the DF4ZS RF
SPEECHPROCESSOR have a current consumption which is in the "OK" range.

Maybe one thing I like to point out again. I DO NOT LIKE to say that
the One-Big-Punch is junk. Definitely not, even as I never hold one
in my hands. The schematic is similar to the DYC-817. But it has to
be build-in into a rig. So the big advantage all the EXTERNAL types
have is that you can easily remove them in situations in which you
get RFI problems, e.g. on a fieldday, bad antenna matching or RFI on
the outer shield of the coax (I don't know the english name, in
german language it's called "Mantelwellen" = "outer cover waves" ??).
This is the situation on which you need a RF coil by winding your

coax or using a ferrite for this.

The OBP is fixed build-in instead. They did some improvements by using a mix of 2 kinds of ferrit beads, but I would expect that on a 100 watts rig this might be even not enough for ALL situations. In case of RFI you would only have 1 option: to reduce the RF power output. Or to improve the antenna system.

To import the OBP from Great Britain or even USA to Germany is much too expensive for me (only to get another test option, ..hi). So unfortunately I never was able to try one out.

But a combination of a HEIL HC-4/HC-5 and the OBP might be a big improvement in my opinion.

http://www.w4wb.com/FT-817-Accessories/One-BIG-Punch.htm

Mmmmmhhh, delicious. Hi...

In the cases in which the OBP is build in into the MIC instead of into the RIG itself there's another trick to suppress RFI. Just buy some "silver fluid" (used for repairs of model railways) and paint all the both inner case halfes with this silver fluid. Before painting fix 2 wires (one for the front case half, one for the back case half) into the plastic by using a little superfast glue. After this both unwrapped ends of the wires are also painted with the silver fluid. With this trick you'll get a "semi-shielded" plastic mic case, ..hihi.

GE,
Not sure if anyone might be interested in dedicating a few months or up to a year on 30 meters, but if you might be interested in trying to get more PSK or digital activity on 30 meters then maybe a group dedicated to just 30 meter PSK might help. If you are interested join in if not no problem (I will be CQing most nights on 10.140 so if you can't or won't respond then give us an email with a signal report on 30). See you on 30 meters PSK 10.140 (10.141-10.142). Thus far about 50 in the group dedicated to 30 meter PSK (or other digital) to increase activity and will have '30 PSK on Thursdays'...so hope to see some folks on Thursday nights.

http://groups.yahoo.com/group/30meterPSKGroup/

Thank you for letting me post here in this group.

Hello Dan,
Sorry for not responding you for the moment but I'm actually hospitalized.
I only have my laptop here, but no Xmitter.
As soon as I'll be back home (I hope next week), I'll gather all information and params from my rig and the PC controlling it.
Since DM780 is provided (I downloaded the beta version on HRD site) I worked with it and I find it more pleasant than PSK31.
I hope being back soon at home.
Best 73,
F1OQE Eef

Dan Gillenwater - K9SLY <dlgillen@...> a écrit :
I would like to hear more about the "settings" you suggest to work PSK31 with HRD, computer and CAT cable.
Thanks

EVERARDUS VAN T HULL <everardus_vanthull@...> wrote:
Hello Sam,
I do¨PSK31 with HRD (Ham Radio Deluxe) and only the yaesu Cat cable
to link the computer. It works great when you have made the right settings on the
FT897(D) and in the PSK31 file. HRD is freeware, you only need the CAT cable.
Hope this will help you 73 and FB de F1OQE Eef

kb2vyp <kb2vyp@...> a écrit :
I hope this is the right plase to ask for this information..

I have the FT 897D & an HP Pavilion computer with Media Center... I
would like to what I need to setup a psk station... I have not done any
type of packet or anything since 1995... I would like to know the
simplest way to set this up, Please help me..
I have read all the information I could find and all I can see is what
you do once you are established and have a problem with your system I
have.. I have read thye owners manuels and they don.t tell me what I
really need to setup a system...
Thanks in advance for any help you might be...

18800. CW Problem

Yahoo group: FT897 (2007)
Date: 2007-05-21 22:01:58 UTC
From: iant1961
Topic: 2176 Message: 18800

I've a problem on an early FT-897 that I am wondering if anybody might be able to shed some light on. The rig outputs in all modes except CW. It keys up, I get sidetone, keyer works but virtually no output. I don't have an external power meter to hand at present but transmiting into a dummy load at 5w and monitoring on my AOR received I get S9 on everything but CW, problem is there on all band HF to VHF.

Done the hard reset bit with no improvement, anybody any ideas ?

Cheers
Ian

I have a new FT-897D so the menu function may not be the same ----Do the following, select the function button "F" and dial to "MFj" which is menu function "J". Make sure that "BK" is in brackets like this [BK]. That will turn on the CW transmit. Without this, you will get the exact symptoms you describe. While you are there, make sure [KYR] is on as well which activates keying for iambic paddles.

18804. Re: CW Problem - service menu anomalies?

Yahoo group: FT897 (2007)
Date: 2007-05-22 19:01:29 UTC
From: iant1961
Topic: 2176 Message: 18804

Thanks Mike, I check that and it toggles between training mode
and 'live' mode fine it's just that the output is next to nothing. It
is transmitting but way down in power compared to the other modes,
don't have a watt meter to hand but very little change in current
drawn when you key the transmitter.

I can't beleive anything is broken as the rest of the rig is fine so
I was reading up about the service menu today and just had a quick
check. There are few values that seem to stand as as very odd. These
are:
001 HF1RXg - 253 (norm 128?)
003 HF3RXG - 255 (norm 128?)
004 50Mrxg - 255 (norm 128?)
058 UHF-REV-ALC - 000 (norm 60?)
059 CW-CAR-LEVEL - 000 (norm 109?)

There were a few others that were quite and high / quite low but 255
or zero didn't look right. I've no real idea what these do but the CW-
CAR-LEVEL set to zero looks very suspect.

Anybody have any thoughts on either how to set these properly or
suitable average values for these before I go with the values I found?

Thanks in advance.
Ian

Although I don't think you have the same problem that I had, I will tell you how the cw function became disabled on my radio. I had an MFJ portable paddle that I would put on top of the radio and operate from there. I did not know that under the paddle one of the wires had a small bear section. This bear spot on the wire touched one of the top cover screws and caused a short circuit and disabled the cw function. I had to send the radio in for repair-- about $85.00.

From: Jason
Topic: 18806 Message: 18806

I have just recieved my Sl1+ radio interface, set the jumpers and plugged everything in, it tx's with no problem but i don't seem to get any receive on it i have several programs that i use for data (mmsstv, mixw, digitrx, hrd, ect) iam fairly sure that one of these programs has something ticked that is causing me the problem.
Has anybody come across this and point me in the right direction.
If in the mean time i resolve the problem i will post on here to save somebody else the agro.

Jed,
First, the keyer output should be wired as if you were plugging in a straight key (check the 897D manual diagram). Second, disable the FT-897D's internal keyer, but keep the "BK" function activated so the rig will transmit cw. Most keyers these days have the correct output voltage to key modern solid state transmitters so I don't imagine you will have a problem (some keyers can be set with an external or internal switch--check the keyer manual).
When you work the paddle, the keyer should key the 897. I have used my 897D with an older MFJ Grandmaster memory keyer with no problems.

I hope this helps.
Good luck and 73, Rob KD7H

18808. Re: CW Problem

Yahoo group: FT897 (2007)

From: kav
Topic: 2176 Message: 18808

Yo!

This may be no help but I'll shove it out there anyway just in case.

My FTthou has a drive control which only operates on a) the speech processor (and mebbies AM?) and b) CW. You can talk all day and night with loads of audio and full power output on SSB or FM but, switch to CW and you'll get san fairy anne if the drive is turned down.

So, does the 897 maybe have a drive control somewhere?

IMVVHO If the tx keys up, you get a side tone and there is SOME power output (even if its only a few milliwatts) then I'd guess its a settings issue rather than a mechanical fault. You might well be onto something with the carrier level setting. The handy thing about those service menus is that you get a numerical display of the value which is real easy to put back. That means you can shift it, test it and put it back exactly how it was without trying to line up 2 tiny paint marks on a pot. If the rigs out of waranty wind the wick up a bit and see what happens. If its still got gaurantee ship it back.

Would love to be more help but my own 897 is almost a total mystery to me. Talk about see it, buy it, find a use for it later.

Hope you find the answer!

Regards

As have I with my Grandmaster keyer. Your keyer should plug right in
with a 1/8" mono plug into the same port as a set of paddles would.

From: Mike Rhodes
Topic: 18812 Message: 18812

Sorry for the clutter but...

A few weeks ago someone mentioned they would like to be able to run their notebook from 12V battery power but their notebook was a power hog at 120 watts (60-90 more typical). I don't remember what brand notebook they were running, much less which forum it was on but am pretty sure it was one of the three I am sending this too.

Anyhow, here is a link for a 12V notebook supply for Sony at 150W. Hope this is what you (whoever you are) are looking for...
http://www.geeks.com/details.asp?invtid=ASO150A&cat=NBB

...and here is one for HP/Compaq at 120W:
http://www.geeks.com/details.asp?invtid=AHQ120B&cat=NBB

Good luck and 73 de

Yes. There is a beacon function. I've never used it but I've seen it many times in the instruction book whilst looking for something else. I believe there are four "messages" that can be sent.

Consult the instruction booklet for hours of fun reading.

18815. Re: Beacon Mode

Yahoo group: FT897 (2007)
Date: 2007-05-24 12:41:03 UTC
From: NF6E
Topic: 18810 Message: 18815

Hi Tom,

Yes to your question, and the feature is very easy to use.

You can create 3 stand alone beacon messages, or string any of the messages together to create one long beacon message.

Put radio in beacon set mode, spin the front dial, select the character you want in a message, push a button to select it, go on to the next. Beacon time intervals are set in "seconds" and also selected by spinning the front dial.

Various software on the market makes all of this even easier by allowing you to type in the messages and time intervals.

Pretty straight forward. You should have no trouble.

18816. FT-857D: Opening TX wide band - no success

Yahoo group: FT897 (2007)
Date: 2007-05-23 05:49:27 UTC
From: Rupert Mohr
Topic: 18816 Message: 18816

After reading everything available (including the fine doc's of Jochen, DG2IAQ), we (df1kbn and me :-)) did a lot of discussion and soldering. Resetting of the TXVR with Home-Poweron or V/M-Func.-Poweron had no success, except resetting the memories. Our guess: One of those undocumented little switches might have to be used as some new builtin feature?!

The nicer Software-Mods are a little bit outdated, cause nowadays people no longer have seriellports... The newer programs let you choose the comport, but: My USB Cat Cable uses "COM29(38400)", which is not supported by the programs available here in the group.

One short note on mods.dk: In former time this was a great help, if you needed just one fix/mod. Nowadays it seems to me that all tipps are splitted into sentences and you need a couple of days to get the needed info, cause you can only read one tipp per day :-) ...

18817. "blop" sound during power up - FT-897D

From: hamradioprofile
Topic: 18817 Message: 18817

I recently purchased a FT-897D radio. I must say that I am very impressed when looking at the radio itself. The audio is good and I have a good report on QSO. I have a few question.

1. Is it normal that during power-up, there is a sort of "blop" sound coming out from the top of the radio? I am not sure f it is coming from the speaker or from the relay inside. Can someone let me know?

2. I don't have an external SWR meter. Can we trust the internal SWR meter??

Subject: RE : [FT897] whats needed for PSK 31 setup

Hello Sam,
I do¨PSK31 with HRD (Ham Radio Deluxe) and only the yaesu Cat cable
to link the computer. It works great when you have made the right settings
on the
FT897(D) and in the PSK31 file. HRD is freeware, you only need the CAT
cable.
Hope this will help you 73 and FB de F1OQE Eef

I hope this is the right plase to ask for this information..

I have the FT 897D & an HP Pavilion computer with Media Center... I
would like to what I need to setup a psk station... I have not done any
type of packet or anything since 1995... I would like to know the
simplest way to set this up, Please help me..
I have read all the information I could find and all I can see is what
you do once you are established and have a problem with your system I
have.. I have read thye owners manuels and they don.t tell me what I
really need to setup a system...
Thanks in advance for any help you might be...

18821. Re: ldg at 897 tuner for ft 897d

Yahoo group: FT897 (2007)
Date: 2007-05-14 20:33:32 UTC
From: ke7ego
Topic: 18758 Message: 18821

Actually, I believe it's the other way around....Release the button
as soon as the red light comes on and it initiates the tuning mode.
Holding it places it in bypass mode.

18823. Cable for Memory Management and Software

Yahoo group: FT897 (2007)
Date: 2007-05-24 14:50:18 UTC
From: Steve
Topic: 18823 Message: 18823

Hello All, I have a cable question. I want to use FTBasicMMO to manage my memory. What cable do I need? Will the CAT cable be sufficient? What other software programs manage the memory? I am new to HF and just purchased the 897d. I am also demoing the TRX-Manager software and it seems to expand the functionality for the 897d. The CAT cable works with the TRX-Manager software but does not manage the memory. Is there any other software that would help with this radio? I am looking forward to hearing your suggestions.

18824. Help troubleshooting

Yahoo group: FT897 (2007)
Date: 2007-05-24 13:49:56 UTC
From: Mike Lewis
Topic: 18824 Message: 18824

Hi All:
Hoping to get a little advice troubleshooting my 897. Just recently got my 897 used and I think I've managed to break it already. I have inadvertently transmited on 6m but had the HF dipole selected on the tuner (DUHHHHH). I don't seem to have any HF output any longer but I do seem to have VHF / UHF output. I assume that I've damaged the finals and will now need to send the rig out for repair, but I thought I check with the group to see if there maybe some other things I should try.

In reading through the archives it seems that are some issues with damaging the output drivers during tuning and I'm going to check out building / buying one of the devices to enable tuning at low power. Any other 'critical tips' like this for a newbie 897 owner?

Thanks es 73,
Mike K4MPL

From: hamradioprofile
Topic: 18826 Message: 18826

Hello, I own the 897D and it is a great radio.
However, I have a question.

1. Is it normal there is a "blop" sound coming from the radio during power up? I think the sound is either from the speaker or the relay inside.

2. Can we trust the internal swr meter? I am thinking of buying an external swr meter but before I proceed, asking here may help.

Regards.

One thing I have found on a diesel here was teh tachometer sensor... I caused all kinds of noise,

For the after market electric fuel pump, Bypass caps will do wonders. Do ot forget, if you put a cap ACROSS teh + and - terminals, use a resistor in series..... other wise, you will eat up the contacts..... See the ARRL handbook for details. You need to bypass BOTH sides of the power leads
to ground. If you can find Coaxial Capacitors. they will strip the noise. Motorola used to use them in
their noise kits. Have not seen them around for a while.

Jean-Michel, the FT-897D logo on the radio does not show the 'D'. Your radio is likely new stock. If the serial number shown on the radio matches the one on the box then you should be OK.

chapronfr <chapronfr@...> wrote:
Hello

I Just receive my new FT 897D. Nice Rig but one thing I don't understand.

The box and the docs said FT897D but in the front panel logo it is writen FT 897 I miss the letter D. Is it normal or did I get an old FT 897 from my dealer?

I appologise for a so simple question and my bad English, but I will be very glad to know the version I get.

Thanks for taking the time to try to read my poor question

I'm not sure exactly what sound you're hearing but there is a slight relay click along with the two-tone beep when I power up my rig. If the sound you describe are either of those it's most likely normal.

Regarding the SWR meter - the internal SWR meter on my '897D tracks with that on my LDG autotuner. I'm sure it could be considered to be accurate enough for normal operation. Just remember that the SWR has to be at least 2:1 before it really becomes an issue.

hamradioprofile <dexterpatrick@...> wrote: I recently purchased a FT-897D radio. I must say that I am very

Hello Jay. You made me get my AT897 manual out. I'm afraid you are mistaken. Quoting the manual: "To place your AT-897 in bypass mode, press the Tune button on the front of the AT-897 tuner and quickly release it before the red LED comes on (less than a half-second)."

As I recall, with this particular problem, David found his problem to be in the 1/8" cable installation.

My 897D make a short (about half a second) two tone, low freq first out of
the loudspeaker.
Also there is a relay click heard.

It's always done this at switch on.I believe it's normal.

Steve,

I use the CAT cable with FTBasicMMO for memory
management on both my FT-897 and FT-817.

It's a clone cable (non-Yaesu), serial lead and I have
to set both DTR and CTS to on - this gives power to
the level convertor built into the 9-way D connector.

My programming PC (an old laptop) doesn't have USB.
Are you using a serial cable or USB?

Hi Mike.

A ham radio operator asked me the same question around 1 or 2 years ago. I went back deep into the details of the FT-857/897 schematic and my answer was definitely:

"No, it's NOT possible."

The reason was that the AF-PA module is muted during TRX. I don't remember correctly but I think it might even be OFF DC power supply while TX !? To unmute it and use it as a monitoring function this might result in an AF noisy (maybe some pre-stages are still powered as well and overlap with the monitoring audio !?) or in a RFI sensitive environment.
And how would you activate/deactivate it !? Of course there's only room for a separate mechanical switch on the upper case, but how does this look like !?? Aaaarghhh..!!! Hihi.

I decided that it's definitely NOT worth that.

My WORKING suggestion therefore would be to build in a separate monitoring AF stage (e.g. with an LM-386 like on lots of CB handhelds) and a separate headset socket. So the monitoring function would be a totally separate stage from the rest of the rig and cannot affect its function (...if you still DO NOT PROVOKE RFI stray with that !!! It's a design and RFI shielding problem.)

But finally coming to the really MAIN PROBLEM:

The monitoring function is still an only AUDIO-BASED solution. You cannot hear any RF signal of your transmission as you would need 3 separate detectors for this as well (AM, FM, SSB). To get all the 3 modes audio you have to pick up the AF signal before it's divided into the 3 modulators.

So if your FM modulation is totally overdriven and clipped, ..you won't hear it in the monitor cause the clipping stage is behind.

If you play with your SSB IF carrier shift to get more/less basses or be pitched, ..you won't hear it cause this IF stage is behind.

And here I stop with my long posting.

I'm sure you might all agree now that it cannot be solved EASILY and with a SENSE FOR THE GETTING RESULTS.

Sorry to say that, ..hihi.

If you really like improvements just try my "DG2IAQ modification sheet" and "SSB BIAS fix" for the FT-857/897 on www.mods.dk -> Yaesu -> FT-897, ..., replace the stock mike by an electret capsule circuit and finally use a wide 2,7 kHz filter (maybe only for TX if you prefer, but I use it for both TX+RX).

Then the baby rocks !!!...and believe me, it has NOT to be monitored, ..hahaha....

Best 73,
Jochen Heilemann (DG2IAQ) www.qsl.net/dg2iaq

> Does anybody know of a way to get audio sidetone into the headphones?
> I'd like to be able to hear my own audio when I transmit.

From the diagram, connecting pin 3 of Q1087 (mic out after the D/A
level adjusters - low impedance output) with a resisitor (10-100k)
to the far end of R1396 - not the end connected to pin 23 of Q1087)
might be able to do the trick.

Advantage is that it's all in close vicinity - no messy wires
that can pick up RF and all that nastyness.

What I don't know, is:
- Is the MIC D/A converter shut down during receive, and during
non-voice modes
- Is the impedance of the pin 3 output of Q1087 low enough to
avoid other audio leakage (spec says 5 ohms so I'm hopeful)

Unfortunately, Q1087 is on the bottom side of the main PCB,
so the PCB will have to be taken out (and re-installed for testing)
This also makes a variable pot (to set levels) more difficult than
I'd like it to be.
I'd also like to make this switchable, but I have not found a
good way to switch this. Has anybody ever figured out whether the
[USER] setting in the PG A setting twitches something we can steal?

Anybody else looked into this?

Another Update.
Radio works flawlessly, Cal Fisher at Ham Repair done a wonderful job!. The radio was return packaged better than I had sent it out. It came back showroom clean. The repair was done professionally, solder joints on the replaced transistor look way better than the factory joints (is that too hard to accomplish) Cal kept me up to date witht he progresson the rig and the repair cost way less than Yaesu could have provided --- In FT897@yahoogroups.com, Ronald Bergantzel <ka0ryt1@...> wrote:

18841. Missing Menu Items

Yahoo group: FT897 (2007)
Date: 2007-05-26 00:08:06 UTC
From: a_levino
Topic: 18841 Message: 18841

Greetings from a Just Got the 897.

I am having problems getting FTBasicMMO to work with the Yaesu CAT cable. One of the things I want to try is to set the baud rate to 9600. When I go to the menus, I get 1, 5, 6, 7, 14, 24, ...

No 19, etc. What am I doing wrong?

Thanks,

Roland

18842. Newbiequestion

From: chapronfr
Topic: 18810 Message: 18842

Hello

I Just receive my new FT 897D. Nice Rig but one thing I don't understand.

The box and the docs said FT897D but in the front panel logo it is writen FT 897 I miss the letter D. Is it normal or did I get an old FT 897 from my dealer?

I appologise for a so simple question and my bad English, but I will be very glad to know the version I get.

Thanks for taking the time to try to read my poor question

Problem solved. After deinstalling some drivers I got a free COM3.
But: The Softjump gives an error message and won't write and the
WidebanderV4 says: Everything ok, Power off/on now. but nothing
changed... Maybe cause some soldering modding had been done before...

From: Steve
Topic: 18823 Message: 18844

Hi Graham,

Thank you for your quick reply. I will try the settings you recomend.

I am using a USB to serial converter with a recent laptop (1 year old). I am trying out a bunch of software on this laptop because I know I will be formatting it after I decide which software I'm happy with. I may be using an older computer after I'm done with the software demos.

Have you ever used the data port on the back of the rig? I plan on trying a bunch of data modes as well but need to learn to use the rig first.

I am very interested in hearing any suggestions you may have with this rig as well as your software reccomendations.

73,

Steve N2VFU

Didn't someone just answer this question about a week ago? What it says on the box and what it says on the radio makes no difference. What matters is in the serial # and the model # printed on the tag on the radio underside. There is where the difference is.

18847. Re: [FT897] Re: Newbiequestion

Sorry to disagree. But even most tag numbers say FT879 and not 897D. Mine is definitely a D model manufactured by the serial number in January 2007, the box and manuals say FT897D, the tag sticker however says only 897. So the radios are a bit hard to properly identify. As my radio has the temp controlled Xtal osc and can not be modified by software only by hardware changes it is the D model. Also they did not manufacture any non D models in 2007.

Steve,

Do you have the full version of FTBasicMMO, or the evaluation copy (i.e. have you registered it?).

If you haven't registered it, you cannot connect to your radio, no matter what settings you use in the comms setup.

At present I do not run any data modes with my FT-897, but if I go down that route I will probably buy a Signalink SL1+ (it will then go with my FT-817 too).

18851. A/B VFO Question

Yahoo group: FT897 (2007)
Date: 2007-05-27 13:14:44 UTC
From: wb2pjh
Topic: 18851 Message: 18851

I am still trying to figure out how to set the VFO A and VFO B for each band so that A gets me to the CW portion and B gets me to the SSB portion. The manual is somewhat sparse in this area <g> and when I try my best to set it up I wind up on different bands!

I am probably missing something obvious so any suggestions would be welcome.

From: K9ZTV
Topic: 18810 Message: 18852

The "D" nomenclature does not appear on the outside of the FT-897D.

Yaesu did the same thing with the FT-1000 . . . the "D" indication appears nowhere on the radio itself but only as a stenciled addition on the outside of the FT-1000 shipping box. Otherwise, you have to go by the features installed in the radio (TCXO, filters, etc.).

Yaesu considers "D" models to be the same radio as the "non-D" models albeit with options previously available at extra cost now included as standard equipment.

The one exception to this is a slightly better roofing filter in the "D" model.

From: K9ZTV
Topic: 18851 Message: 18853

This is one question that can be answered without reference to the manual.

Go to VFO-A, go to a given band (160 for example), dial in a frequency in the CW portion, push MODE until you get to CW, and stop. Step up to the next band (i.e. 80) and do the same there. Likewise for all other bands.

Then . . .

Go to VFO-A, and do the same thing except dial-in a frequency in the SSB portion, push MODE until you get to either LSB or USB, and stop. Step up to the next band and do the same there. Likewise for all other bands.

I have mine set this way, too. One VFO is set to CW, the other to SSB.

Ops who work a lot of DX will probably not set things up this way because they use the opposite VFO for split work.

I am planning on purchasing a new FT-897D. One advantage of this radio is the ability to add an internal power supply, FP-30. Can someome comment on the quality of the internal supply and does it get hot or give off much heat. Can you power the radio on/off from switch on the front of the 897D? Thanks, Gil

on receive only- not a bit that i can feel.
noiseless operation on later serial numbers- early model had some rf hash that was fixable- about 1/2 or so thicker than plate on bottom now- also has stand - you can shut rig off from front but power supply has own switch- directions say to power up supply (switch on back) power rig-- to shut off- power off rig first then supply

From: Robert G. Schaffrath
Topic: 18854 Message: 18856

When I originally got my FT-897D I had not considered getting the FP-30 as I felt it was a bit overpriced at $200+ and I already have an Astron SS-25. However, after traveling with the FT-897D and SS-25 I found it a bit inconvenient to lug both around along with a tuner. I have Pelican case for my FT-897D and the Astron power supply does not fit in it. In August 2006, I saw that Gigaparts.com was selling the FP-30 for $188.10 and decided to get one (BTW, they are again on sale at Gigaparts for $188.10 until June 7th). I have not regretted getting it and the radio fits fine inside the Pelican case. Note that some early models of the FP-30 had a filtering problem that caused hash. That was fixed and the current fixed model is actually an FP-30B.

Gil, I see you already have a couple of answers regarding the heating of the FP-30. It does not run very warm at all. Regarding your question of whether you can still power the radio on/off via the front panel switch, yes, you can, and should. It is better on the radio to power up and down via the front switch rather than applying and turning off the 12V mains. There is a switch on the back of the power supply for powering it up and down.

It may be that the only difference is that the DIG mode allows you to adjust the input level independently from the SSB input setting. AFAIK that's about it.

The digi mode uses the ACC plug on the back for LF in and output and ptt
u can't use the mike plug for DIG
and as said it uses seperate menu's for modulation settings etc.

From: Patricia (Elaine) Gibbons
Topic: 18854 Message: 18864

Since only 20Watts of RF is available via the use of the internal battery option, I opted to install the optional internal AC power supply ... I have not used it all that often, however when setting the radio up in our living room, for example, it is a real advantage to portable operation when near AC power to simply plug the AC power cord into the wall ...

I ran my FT-887D for an entire weekend while hooked up in our living room, and also used a laptop pc and Tigertronics SignaLinkUSB soundcard interface for HF digital modes ...

The optional AC power supply generated no detectable RF interference, and since it is a switching supply, did not add very much additional weight to the rig, so I'd say it is a worthwhile option ....

Many times portable operation is likely from hotel/motel rooms or other temporary locations where AC power is available, so using the FT-897D as a "portable base station" is very useful via the internal switching power supply....

For battery operation, I use an external 18AH gellcell battery pack and this also seems more effective than being limited to 9AH with the use of the optional 4.5 AH batteries that would install inside the rig ...

My 2 cents anyway ..

Elaine

Subject: [FT897] FT897D Internal Power Supply- Yaesu FP-30

I am planning on purchasing a new FT-897D. One advantage of this radio is the ability to add an internal power supply, FP-30. Can someome comment on the quality of the internal supply and does it get hot or give off much heat. Can you power the radio on/off from switch on the front of the 897D? Thanks, Gil

Well, when I registered my 897 online with Yaesu and join their group on the website and was told I was a member of the "family" I emailed them about MARS and as yet I have yet to hear a word from Yaesu. Fortunately a fellow MARS member sent me the info and I did the mod myself. So far so good. By the way this was 2 months ago. The radio is doing a fine job on both MARS and the amateur frequencies.

YAESU generally wants/prefers to receive a PHOTOCOPY of your MARS license, or other documentation, before releasing modification details. Results are generally good, if you MAIL, via U.S. postal service, the copy and a signed request for the info. (This is most likely due to LEGAL issues & FCC hassles.)--73, KC3VO, Bob Curry.

From: lm3ri
Topic: 18868 Message: 18868

I recently came across an article on the web claiming that if the extended transmit mod is done, I will lose the preprogrammed 60 meter frequencies. Is this true? I have the 897D, and have yet to crack the case. Are there any other caveats with the mod? Please post a reply or contact through my callsign at arrl.net. The Burnzomatic torch is ready.
Thanks!

18870. My Shack-N-Bag Approach for Taking the FT-857D Portable - Grab and Go

Yahoo group: FT897 (2007)
Date: 2007-05-29 03:14:41 UTC
From: robert goodman
Topic: 18870 Message: 18870

I've added a new page to my web site that shows my personal packaging approach to turn my FT-857D into something that is as close to portable as my old FT-817ND was. I loved my FT-817...actually, I loved both of the 817s that I have had in the past. But for all its capabilities, I found the FT-857D a MUCH better radio with more power, DSP, speech processing, etc.

The "Shack-N-Bag" is my simplistic solution that lets me combine the bits and pieces of equipment I need into an easy to "grab and go" 14-16 lb. package. I've included about two dozen photos at my site along with all the details for finding all the components I use. I'm sure others have even better approaches - but I offer this one to other members who might benefit from at least some of my ideas.

http://AA5FR.com/shacknbag.htm

Even though my approach was designed around making the FT-857D more easily portable, it will work with other radios like the FT-897D and even as a way to give the FT-817 more battery power.

73,

Robert AA5FR

18877. fm sat. programming

Yahoo group: FT897 (2007)
Date: 2007-05-29 18:49:55 UTC
From: fred t. forbush
Topic: 18877 Message: 18877

I want to program my radio for fm sats. as described in the owner's manual. However, the SO-50 sat. requires a pl tone on transmit. The manual does not describe the inclusion of a tone option in the programming. Nonetheless, I attemtped to include the tone for each of the memory transmit frequencies. After programming a receive and transmit pair I found that the "ten" does not show up on the display when I transmit. Has anyone successfully programmed his radio for fm sats. that require a pl tone?

Thanks for the heads-up on my VFO question, Kent. It's appreciated.

Now, if you can explain how the memory functions work, I'll be *really* impressed<g> (just kidding).

Sometimes I think there should be an "supplemental" manual for this rig made up from collected posts on common topics that come up often. It might be a good project down the road.

Thanks and 73,

Actually, the audio in and out is available on the accessory six pin din plug at the back of the radio. My SignalLink interface plugs right in there. And being a USB sound card itself, just needs to be connected to a working USB port.

Yes, I know that--I've been doing the same thing for years. I am presently using the Navigator interface which does both CAT and sound card function. But that is not the point. The point is that the original post made the statement that all you needed to do ordinary PSK with an ordinary interface was to connect to the computer through the CAT port. That is not true, either with ordinary cabling, a Signalink, or a Navigator. Or for that matter a RigExpert. One way or another you must also connect the rig to *a* computer soundcard, whether it be the computer's own, or some outboard unit such as your Signalink or my Navigator (which does both the CAT and soundcard function).

I would check out the after market fuel pump. Ford has a silent recall on ALL their vehicles made since about 1984 because the fuel pump creates noise on two way radio gear. I personally know 2 people who have had to have the pump replaced by Ford, and their symptoms were similar to yours.

From: Robert G. Schaffrath
Topic: 18854 Message: 18886

I have a Pelican 1500 case that I was able to get new for a very good price on eBay. I had considered a 1550 but they are huge. The 1500 has enough room to let me carry a copy of the operating manual, the FT-897D with FP-30, microphone, power supply cable and USB/CAT interface cable. It came with Pick-n-Pluck foam so I was able to make a custom fitting for all the parts. There is a little extra room where I could probably remove more foam and store another tiny item but it has not been necessary.

I can take a picture and post it if you are interested.

Topic: 18764 Message: 18888

The minimum necessary to operate psk31 is audio cables. I'm using direct (no isolation of any kind) audio cables from my soundcard speaker and microphone to the Data port on the back of the rig. I have had no problems with this what so ever. If your computer is next to you rig then the cat interface is not necessary to perform psk31, but would be handy. This method does require psk31 software and the rig to have vox enabled
The only drawback is adjusting the soundcard volume through the volume slider bar (either within psk31 sw or pc) . To have better control of your volume control goto http://www.nirsoft.net/utils/volumouse.html and download volumouse. I have found this very usefull in tweaking the volume. I mainly use the alt key and my scroll wheel and have set the step to 100. This steps the volume by .2 or .1.

This is incorrect. You also need a cable from the audio out/in on the rig to the corresponding input jacks on the soundcard.

From: Roger Hunt
Topic: 18889 Message: 18889

Hi All....My FT897D has developed a problem, it is locked on 7.0 mhz and does not transmit, the band change and mode change buttons do not work.The first time this occured a 'reset' got it going again, this second time a reset makes no difference to the problem. The manual is a 'big' read and I might have missed something relative, however any help would be appreciated.

From: K9ZTV
Topic: 18851 Message: 18893

Hi Dave . . .

No "supplement" from Yaesu, anyway. None of the big three are very consumer-communicative. You have to buy TenTec and Elecraft to get that.

The manual is actually divided into two parts and most hams having problems with the 897 only read the first section (which admittedly is not always that clear). The first section runs from the front cover to page 51 (in my manual, an early one). The second section, entitled "MENU OPERATION," runs from page 52 to 60. Some questions are answered in the first section, but not the second; some in the second, but not in the first. But between both of them, most user questions are answered.

Feel free to email me with any questions ... I've figured out just about everything there is to know about this rig except digital stuff which I don't use.

18897. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2007)
Date: 2007-06-01 10:53:17 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 18897

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

From: Mark Vaughan
Topic: 18890 Message: 18901

Yes easy.

It sends more than 9V normally about 11 to send the antenna up.

It sends about 8 volts to bring it down.

It remembers what band it was tuned to last time so it knows what direction to go, then it looks at the reflected power, when this drops below a level set in the hidden menus it stops the tuning.

There is a ATAS group on yahoo, there you will find files on the antenna construction including the circuit board which may be of use.

I have been playing with motorised slinky spring antennas which if I ever get time to finish I may use the ATAS output on my FT847 to tune. It's a shame though we can't trick it to go below 7MHz.

If the plug isn't in quite tight the barrel of the plug will also short the terminals for the key. Yaesu have a habbit with many of their radios of putting the sockets behind a hole that is too small for the barrels of most connectors so when you put an aftermarket connector in it barely goes far enough to work, and a fraction out and it mucks it up. If you shave the barrel ov the connector so it goes in further the problems goes away. Unless as Peter says you close the key and power up.

I use a Tigertronics SignaLink USB with Inbuild Soundcard and VOX. You only need a USB-connection to your PC and the seriell Interface for the 897 if you want to control the RIG from the PC. Very ease use and
setup and the internal PC-Soundcard is free for other Things.
Software: MixW is okay but have also a look for HamradioDeluxe (Build 1466) with Digital Master 780. It's Freeware and HRD is very good for RIG-Control, Logging, DX-Cluster and Remote Control. DM780 is the
part for the Digital Mode and the Replacement for PSK31Deluxe. It's designed to be a Multimode Programm at the End of the year. The Public Beta has the PSK-Modes implemented. We have a internal Beta with a
new PSK-Engine and the first additional Mode (RTTY) in use. There are a few Bugs so it's not for Public at the moment.

something strange. First I'll try fm with stock mike. If it works ok
go to second, if something other is wrong.
2) switching to the heil element, adjusting the fm mod. deviation (I
don't remember the menu number.. but I am sure that you have already
found), you'll be able to regulate from 0 (that is NO deviation at
all) to the point it seems to work the best. May be the heil capsule
has a much higher output than stock mh-31. I also use different mikes
and my setting fm mike level goes around 10 to 15
all the very best

18906. Re: heil mic question

Yahoo group: FT897 (2007)
Date: 2007-06-02 09:29:52 UTC
From: Jochen - DG2IAQ
Topic: 18904 Message: 18906

Hi David.

I never owned one but what I know from the HEIL Traveller is that it contains an electret capsule (instead of your dynamic capsule of the MH-31). But an electret capsule needs to be feeded by a DC BIAS. And the FT-857/897 provides +5V on one of its pins of the mic socket.

So for me it just sounds that you use the wrong adaptor cable and the CB bias does not get through to your capsule.

Maybe your shopman can check this. Normally an electret capsule should be at minimum 5x as loud as any stock dynamic capsule and normally the audio level has to be reduced (if the manufacturer does not include any level attenuator at the mic out line).

Best 73,
Jochen Heilemann (DG2IAQ)

Topic: 18899 Message: 18907

> Does anyone have the mod necessary to open up the transmit on a Japanese
> version of the FT-897?

Check if the radio has a J-mark on the label. J-mark looks like a J in
a triangle, point up.

If your radio is a J-mark radio then you are probably out of luck,
as the CPU's in these radios come with different software that
has the Japanese frequency-allocation coded in w/o the ability to
change for different markets through diodes/jumpers.
(which is what you are doing when "modding a radio").

This may sound restrictive but over here, unfortunately, the FT897
is quite popular with CB-ers, 45-meter pirates et all, and J-mark was
set up to avoid similar problems in the Japanese market.
It does spoil the fun somewhat when shopping at Akihabara though..

I'd suggest you contact Yaesu and ask for possibilities to change
or re-flash the CPU. Or, try to sell the box to a European as
our 2m and 70cm allocation are the same as in Japan so using a
J-mark box here is less of an issue.

Sorry,

Geert Jan PE1HZG

18912. Mic Settings

Yahoo group: FT897 (2007)
Date: 2007-06-03 02:54:19 UTC
From: Michael L. Otis
Topic: 18912 Message: 18912

I didn't want to drag out the other thread. I just purchased a 897 and received it in the mail yesterday. I'm planning on buying a Travler Mic to use when I'm mobil. My question is: Do you have to make these settings every time you use the radio or change bands or can you add that information when you save a freq into memory? Otherwise it seems like a lot of trouble.

Michael L .Otis k0tis

18913. update Ignition/injector noise.

Yahoo group: FT897 (2007)
Date: 2007-06-04 00:15:53 UTC
From: James Wilson
Topic: 18739 Message: 18913

I had a breakthrough. I still have a ways to go but I now "only"
have S7,S6 noise on 20 meters.
Here is what I have done so far:
Grounded the muffler this resulted in noise dropping from S9+ to S8.
Grounded the hood and tailgate no noticeable change.
Installed Ferrite beads on the computer and aftermarket fuel pump.
Noise was now s7 to s8.

What was weird is the noise didn't change weather or not I was on ACC
or with the ignition on. I decided to use an old computer
troubleshooting technique to remove everything not needed, so I
turned of the radio, no change. I then unplugged my XM radio that
goes into the radio through the cassette deck. I honestly didn't
expect any change at all. To my surprise the noise instantly dropped
to S6.

I believe I have found my next biggest source of noise the after
market fuel pump and the injector pump. I found this by dragging a
short coax lead around the truck. I am out of Ferrite beads at the
moment but I think if I put one at the injector point it will help.

I thank you for all of the progress I have made so far. If you have
anymore advise I welcome it.

18914. Re: Mic Settings

Yahoo group: FT897 (2007)
Date: 2007-06-04 14:25:59 UTC
From: Bill Barron
Topic: 18912 Message: 18914

There are FM / Digital/ and SSB mic gain settings in the menus.
Once you set them, they apply to all bands.

Contrary to other reports, I leave my mic gains at 65-80% for
the Heil mics and they work great. I would have absolutely no
audio at 6 - 17% gain!

Please note that the DSP Mic equalizer menu will affect your
mic gain settings. Leave the menu set to 'BOTH" and use levels
recommended in manual. If the menu is set to the default 'off'
you will sound very tinny on the air and flat-top at mic gains
over 20%.

From: Michael Colvin
Topic: 18915 Message: 18915

I'm a geezer making plans to enter the Peace Corps and I need to sell my gear.

FT-897D (1 year old): $750 (includes standard microphone, data cable, small external speaker, manual).
FT-857 (3 years old): $550 (used mobile, includes remote kit, standard microphone, mounting bracket and gooseneck, external speaker, manual).
FT-817 (5 years old): $375 (has a small clean crack in one corner of the glass on the front display, modified to accept rechargeable batteries, standard microphone, manual)
LDG Z-100 ATU with One Button Tune for the above rigs: $65
MP-1 Superantenna with all of the extras and more: $150 (standard mounting bracket, mounting bracket for FT-817, 80M coil, tripod with an extra set of custom extra long legs).
Mountain-Ops Communication fabric pouch for FT-817: $40

Pictures of any of the gear upon request. Serious inquiries only, please.

Ship CONUS postage paid by buyer per your preference.

I will accept PayPal.

Please reply off group.

18917. PSK31 CW or DSP filter question

Yahoo group: FT897 (2007)
Date: 2007-06-05 05:49:00 UTC
From: James Wilson
Topic: 18917 Message: 18917

The 20 meter band was hot tonight and I found another limitation of my station then another feature of my station. I hope this might help someone. I had 2 or 3 booming stations on PSK and several weak stations. The AGC on my radio was being hit by the stronger stations. Normally I would use the IF/Shift feature of my radio to tune out one side of the PSK frequency. However there was more then one station surrounding my DX station, Russia.

I was thinking about purchasing a CW filter, then I did a crazy thing and looked in the manual. I know crazy. Anyways I found the DBF filter was just what the doctor ordered. I set the HPF to 1000HZ then the LPF to ~ 1300 HZ. Then turned on the DBF filter. I then used the VFO knob to find a quite part of the band and called CQ DX. Within a minute of calling CQ DX OE6GRG popped up responding to my call. The end result was me getting Europe for the first time and with several loud stations.

Compared to $4k radios this is kind of kludgy but it works. If you have any questions let me know.

73, K6WRJ James

P.S. If your wondering why I posted to the both FT-857 group and the FT-897, it's because I am the happy owner of both Radios.

18918. Re: A/B VFO Question

Yahoo group: FT897 (2007)
Date: 2007-06-05 10:33:58 UTC
From: David Mitchell
Topic: 18851 Message: 18918

To Kent and the Group,

Thanks for the suggestion, Kent, but I am still having difficulty getting the VFO A and B settings to "stick". It works fine if I stay on a single band, but once I turn the rig on again, I'm still band hopping instead of going from the phone to CW portion and back as I desired to do.

I stopped at a friends' house who has the identical rig and it works fine on his radio. Is there a menu setting that I'm missing? Is there a way to "clear" the VFO settings out and start from scratch? Clearly, I'm missing something that I need to do along the way to get the VFO settings the way I want them to be.

The rig works perfectly in every other respect and I purchased it brand new.

Thanks for the heads up.

Good point, Tim, I won't be leaving for a while, so there will be time to buy an FT-817D if I decide to take it with me. The Peace Corps is a little skittish about amateur radio being used in its service, because of the potential for being identified as CIA, which is the last thing they want to have happen. Unsophisticated folks too often are frightened by technology anyway.

I understand. I have been in places where just a camera can get the local militia annoyed. You can always have it shipped to you after you get in country. That way you can start to gain the confidence by elmering some kids that show interest in the theory side. You'll be astonished at how hungry those young minds are when it comes to the math and sciences. It is great to apply that with radio practices.

Sorry that I didn't see and read all of the long thread about this
until AFTER I sent my query. My bad.

I will say that I definitely have spent a lot of time reading the
manual. I find it one of the worst that I have ever seen. But that's
a rant for another time. One person did mention that the info about
this function is on P19. That's correct, but a lot of people might
skip that section if, like me, you don't own an external meter.

Thanks for your patience and not RTFM'ing me.

If memory serves those menu options only apply if you're using an
external meter such as LDG's FT Meter.

Menu items 60 & 61 change the transmit / receve ANALOG (i.e external) meter.
To change the transmit meter
LCD display use Multifunction row i. Receive meter display is always
S-meter.

Subject: [FT897] Re: Ft 897 D .. Cannot change meter mode .... ?

I just noticed this as well. These 2 menu items (60 and 61) don't seem
to do anything. There is another way to change the transmit meter
display but is there any way to change the receive meter display???

Does anyone know why these menu items don't work?????

Thanks,
FiSH de K6FSH

I will tell you all from experience that the external meter is well worth the extra cash. I am using it on my 897 and enjoy having it. I have it set up to monitor the SWR on transmit and S meter on receive. The (bar graph) meter on the 897 is set up for power on transmit and the default for receive.

The thing I like the most about the external meter is the ability to actually see a value on the meter.

18934. Weak Signal with ft 897

Yahoo group: FT897 (2007)
Date: 2007-06-08 02:19:51 UTC
From: Tom Leggett
Topic: 18934 Message: 18934

Having just gotten mine operational there, I wonder if any other 897 operators have done any 2 meter and above weak signal operation. I ask as I was heavily into it several(many) years ago. My rig,amp and antenna combination seems to be doing ok. I would like to find some others to test it with. I am presently on six and two ssb/cw. Need to get a switch box and a 432 mhz. antenna to utilize that band.
Equipment is;
ft897 at 25 watts
Mirage amp with preamp running 150 watts out.
Antenna is an old 11 element Cushcraft(144 version)at about 30 feet.
Hope to replace the 11 ele with an eight ele. quad in time.
Any interested parties contact at n5kwb@...

Thank you

Do you mean Emmet county and the KOA on 31 near Petoskey? If so, you're welcome to come visit our group's Field Day site just S.E. of Petoskey off Krause road, or for that matter, to park your camper up there for the weekend. We have tons of room for other's to park and plenty of open space for antennas there. Our E-Comm group is planning on being there with our new communications trailer we're working on fitting out now in addition to the SAARC club.
The two things I want to play with up there that weekend (if I can get much time away from home--that weekend is my youngest daughter's graduation party) is my AS-2259 I'm going to re-string for the Ham bands and my Buddipole system that I still need to get more experience with.
BTW, funny you mention the museum ships. We're just now waiting for a response from the Icebreaker Mackinaw museum ship in Mackinaw City regarding our proposal to install and operate a permanent Ham station and repeaters on-board. Keeping our fingers crossed on that one.
In any case, give us a shout on Field Day weekend from the KOA. The SAARC club call is W8GQN and the E-Comm group call is W8CCE.

Steve:
Well, units like the KAM XL pretty much do what you want. If you want more you can consider one of the SCS units like the PTC-II Pro, which also do PACTOR-II and III. These are pretty much plug-and-play with the FT-897. If you get the PTC-II or similar, they can provide you with both the data and control cables that just plug into the 897. I've been testing the PTC-II Pro with my FT-897 (and some other equipment) for some E-Comm work and am pretty happy with it.
I can't say that they both work with "any digital software", but there's more than adequate applications that will with either or both. Both will also do PSK-31 without using the computer's sound card and of course you can use a simple terminal program for either as well.
Neither is cheap, but you asked for everything. Do you have any specific uses you're looking at or do you just want something you can do whatever with?

From: Steve
Topic: 18937 Message: 18940

Thank You for the reccomendations Chuck.

I will look into the features of both devices.

Basically, I have an 897d that I control using TRX-Manager installed on a laptop computer. TRX-Manager uses the CAT port on the back of the 897d so I dont want to disrupt this. I want to start doing some digital stuff but want to use some other programs along with the TRX-Manager program.

I want to make the right choice in one device. Portability with the rig is important but not a requirement (Keeping the devices limited to one would do this and also keep the wiring to a minimum).

As many modes as possible would also weigh my decision greatly.

Here are some modes that I am currently interested in: Packet, PSK31, PSK6x, CW(READING and KEYING), RTTY, PACTOR

I am new to HF and have never done any digital comm so please bare with my questions if they seem to be simple.

Does anyone know of a CAT splitter device? I see there is an automatic tuner that has a CAT through feature. Is this a common feature?

Steve:
Just a note that the PTC-II Pro has a control port that can drive the CAT port on the 897 directly. You don't have to use that, but some software, particularly Winlink, can use that to control the radio. Don't think the KAM XL has that built in.
Considering that you want to use the TRX Manager with the radio, you could probably just do that for radio control. I suspect Winlink could use the computer's serial port anyway.
Both of the units do most of the normal modes. Don't know what PSK6x is (am I out of date already?), so can't say about that. All the other modes you mention are covered.
Not sure about the tuner/cat thing. It seems I've had to keep messing with the radio menus to deal with that when switching things around. I'm sure someone else will have more input on that.

Andy

I suggest you have a look at the mods suggested by DG2IAQ. There is a fix for the internal speech processor which involves removing a resistor and fitting a couple of "limiter diodes". He claims it fixes the "menu" processor to make it work, if you are game to do it! Not for me with me old eyes and shaky hands!

So

I took the easy way out and had a "RF" speech processor fitted into the Yaesu standard MH-31 microphone by DF4ZS. He offers to fit the processor for free if you purchase the module which he produces. I am more than happy with the results of this procecessor. I did have to adjust mic gain levels as the output is much higher than with the standard mic capsule and adjust clipping levels and tone of audio, as he suggests, to suit my "rough old Australian voice.

By the way - what made a hugh difference to the sound of my FT897 was setting the driver and PA bias levels to the correct values. Note: They were way out when I checked them.

I now have a great sounding FT897 as reported by the more critical of the local operators.

Hope this helps....
Dave VK7DM

The only time I've ever gotten that to happen was when the coax wasn't connected properly. Make sure the coax is connected properly at both ends. You might want to try using a known good coax to swap with the one you have now to rule out coax problems. Also make sure the power to the radio is enough to power the motor inside the 120. Also, if the antenna is fully retracted, it probably won't move, but the display should change from INIT to ATAS after awhile.

18948. Re: K40 Speech Processor Mic with FT897

Yahoo group: FT897 (2007)
Date: 2007-06-09 11:19:58 UTC
From: Jochen - DG2IAQ
Topic: 18936 Message: 18948

Hi Andy,
hi Dave.

Luckily I received the "daily digest" and read you postings, ..hi.

First of all I like to clearify with my actually (!) knowledge (which is not totally included in my "DG2IAQ Modification Sheet" Dave mentioned).

I own a FT-897D with serial no. 3xxxxxxxx, meaning produced in 2003. On this one and on all earlier ones the speechprocessor DEFINITELY does not work (significantly). The only thing you can recognize is a little "fuller", but distorted audio. The reason is that you have to raise the "PROC MIC" level in the user menu up to the maximum of "100" until you hear a slight difference between ON/OFF.

But this does not necessarily mean that the result is great,...hi. If you go up to the limit the modulation gets more and more distorted and this is NOT the key for a typically speechprocessor.

On later models (I think beginning with serial no. 4xxxxxxx and later) YAESU did a factory fix and they build in simply an additionally capacitor. This one has 2 results:

1)
It amplifies the audio as it lets the pitch tones through and not attenuated by the (usual) resistor in parallel.

2)
It is designed to act like an audio highpass filter as well. The edge frequency is around 500 Hz, meaning all the basses below 500 Hz are still on the same level than before (-3dB/octave), the frequencies above 500 Hz are not attenuated by the resistor in parallel (which is a resistor in series, so the audio has to go through).

The result is significant by this simple add-on !!!

The PROC MIC level can be reduced to "30" - "50" and while switching the PROC on the audio gets highpitched and louder.

So forget my diode-clipper, the simple capacitor fix is done much easier !!! Even if I DO NOT understand a simple highpass filter and a slighly overdriven (and therefor limited) audio amp as a "typically" speechprocessor,...hihi.

The YAESU FIX:

Just add a 15nF (0.015mF) capacitor in parallel to R1436 (22k)

You can find this in the servicemanual of the FT-897, on page 21 (schematic). Just have a look to the lower, right corner. There you should see the big square DSP IC (Q1092). Above this there are some other IC's in a series. Above them there's a little darker, thicker horizontal line (which is the BUS system). Just above this line you'll find the TX audio mixer IC Q1087. Right of this there's a Q1118 (pins 5,6,7).

And below this there's another Q1118 (pins 8,9,10). And this is the one we have to look for. On its right side you'll find R1436 (22k). Add the 15nF (0.015mF) capacitor in parallel to R1436. That's all.

You can use a small, ceramic one. It's not needed to use a SMD type as well. But the ceramic one should be so flat that it does not get higher than all the other parts of the lower PCB around !!! Otherwise you will break some tiny SMD routes by reassembling the PCB back to the case by giving some mechanically pressure/stress to the PCB on fixing its screws.

Unfortunately those parts are on the lower side of the main PCB, so the main PCB has to be removed (which is not tricky I think, ...and it gets more and more easy the often you do this !! Hahaha... Just ask me. I did this several times until everything worked as it should, ...hahaha.)

I agree with Dave that the real RF SpeechProcessor of Joachim Münch (DF4ZS) is a much better solution as it cuts the audio on a 455 kHz SSB level and converts it back to normal AF. And all is done in the microphone by this small circuit !

--> just see: www.jwm.de

There you can find an audio comparison, done by me, as well. I like the design of Joe's RF speechclipper and some time ago we even tried to improve it, what is since then in his later models.

My build in diode clipper was a first try. Some weeks ago I removed it and I tried an improved one (which I first tried in my CB President Jackson). But this improved one is not published yet. It gives a cleaner (processed) audio than my first version. But even the 1st version is better than an originally FT-897 with serial below 3xxxxxx, ..hihi.

And adding more parts to the really tiny SMD parts is always a tricky work !! Please take care on this !! Or please give the rig to somebody who is able to do this work correctly.

So finally, after this (longer than expected) posting I like to wish you "good luck for modifying" !!!

Best 73,
Jochen Heilemann (DG2IAQ)

The data jack can output audio. Can it input audio as well? I'm thinking about phone patching or feeding NASA shuttle audio to the rig.

The DATA jack will handle input and output. The output can be either 9600BPS audio (discriminator output non-conditioned) and 1200 BPS audio (conditioned - considered to be voice quality). Use the 1200BPS output pin. Also, squelch output gives TTL voltage whicl lends well to transistor switch to trigger other device.

Not sure what your question is, but pinouts of the rear panel jacks can be found in your manual, on page 18.

Yes, it can input audio, but only in DIGI modes, not in SSB / FM mode (on my FT-857D)..

It has been awhile since I set mine up, and this may not be your problem, but I seem to remember that when you set this up initially, the "init" process takes a fair amount of time to complete. So, possibly you are not waiting long enough for all that to happen. Otherwise, I would suspect that you have some sort of connection or ground problem.

Whenever you enable the ATAS on the 897 or 857 for the first time, it has to go through the initialization process. It may take up to 3 minutes, even though the antenna doesn't move.

After that, the rig will come out of transmit and the display will show ATAS where it showed INIT before.

This will also happen every time that you turn off the ATAS in the menu. I have a switchbox between the ATAS and a 75m Hamstick, and I always turn off the ATAS when switching to the hamstick, so I see this often..

If your ATAS doesn't return to the bottom while in the INIT process, then it isn't getting sufficient voltage to operate it. This could be die to water in the connection, or poor connection.

It is a good compromise antenna; very flexible and fairly good performance for what it covers. However, it is a bit finicky at times. My FT-100 tuned my ATAS120 fine, my FT857D will not tune it on 40M.. I have to tune it manually using the up/down buttons. I have already added counterpoise wire from the previous installation with the FT-100.

18957. RECEIVE AUDIO FROM FT897

Yahoo group: FT897 (2007)
Date: 2007-06-11 05:03:25 UTC
From: delta7mike
Topic: 18957 Message: 18957

I see this subject received a fair amount of attention in this group some time ago but seemed to "get off the rails". This is my experience ---

I was not impressed with the receive audio quality from my FT897 and when I purchased a Palstar R30 CC receiver I certainly noticed the difference. Most noticable on SSB reception. Lack of low frequency response and what I would term "a digital sound". I also use an old FT7 and would even consider the audio on this to be superior although it does not perform as well "RF wise". To attempt to overcome this I have done several things:

Used a good quality external speaker - helps alot obviously.

Fitted a 2.6Khz SSB filter as suggested by Jochen DG2IAQ. A worthwhile addition but still did not improve quality to my satisfaction.

Had a professional electronic serviceman friend change the capacitors in the audio circuit to higher values (as once again suggested by DG2IAQ) after looking up the typical operating circuit values for the TDA2003H audio output IC used by Yaesu. Hard to judge the effect of this without comparing with an unmodifed transceiver along side.

I have NOT changed the "slow AGC" capacitor value C1503 as yet and wonder if ANYONE HAS DONE THIS AND WOULD WELCOME COMMENTS!

As a final I have even arranged receiver muting and antenna switching of the Palstar R30CC via the CAT/LINEAR socket so I can use the Pastar as a substitute receiver during QSOs. In difficult QSOs, and with some transmitted audio characteristics, the difference produces easy intelligability as against difficult! Note: I am not plugging PALSTAR - this is just my modern comparison receiver.

Would like to hear from Jochen on this if you have time. My FT897D is S/n 4J40xxxx. It has the factory processor mod and also the RD07MVS1 FETS in the Driver (thank goodness). Thanks for your mod sheet - it has been a great help especially in "fixing" many of MY problems.

18958. RE: [FT897] RECEIVE AUDIO FROM FT897

Yahoo group: FT897 (2007)
Date: 2007-06-11 07:05:21 UTC
From: Mark Vaughan
Topic: 18957 Message: 18958

I've done Yochens Squelch and AGC mods though I use 10uF for both of them.

The squelch mod is good, if you run mobile, without it the radio is always tripping in and out of squelch as you pass every lamp post, truck or car. With the mod the squelch is useable, but if you want to use the scan function you will have to turn it back a bit, and you need stronger stations to be able to break through the squelch, since the scan speed is quite hi.

The AGC mod is also good for HF, it basically damps the AGC response and stops all those static pulses pops etc from breaking through.

As for audio output quality, the total harmonic distortion is dreadful, especially at the volume levels needed for mobile use. Yochen also recommends a Midland or Alan DCSS48 dsp speaker with some mods. The first mod is to remove the 8 ohm load the speaker uses to simulate a speaker, this reduction in speaker load to the 857 drops the thd very low, the speaker then needs some mods to balance the gain before and after the DSP circuits so its better for mobile use. Makes a brilliant combination with it's DSP, nice clear clean sound, so ,much so the XYL is happy to let you work HF SSB while driving, since there is no hash.

Yochen does hang around here sometimes so you may get a reply from him.

18959. Re: RECEIVE AUDIO FROM FT897

Yahoo group: FT897 (2007)
Date: 2007-06-11 09:12:46 UTC
From: Jochen - DG2IAQ
Topic: 18957 Message: 18959

Dear Dave,
dear Mark.

Thank you for the compliments. I'll send you the money we agreed for this statement soon, ..hahaha.

Actually I'm in the office and I'll come back to this thread soon. I just discovered some few more audio hifidelity mods 1 week ago and did it on my own FT-897D (with INRAD 2.6 kHz SSB filter). Now the rig blasts your head off.

I'm very satisfied with the audio now and the mod (removing 2 further SMD caps) can be done from the upper side without the need of removing the main PCB. It's only to remove the 3 kHz lowpass filter which is in front of the electronic volume and AF audio amp. Now the audio goes up to 8 kHz (it was the farest I tested on my spectrum software) and can later be sharply limited by the DSP functions, if needed. If you now switch the DSP to the highest setting (6 kHz) it I S definitely 6 kHz and not attenuated at 3 kHz like before.
Even on W-FM you can listen to the radio broadcast stations like on a usual FM radio.
The "muffled" sound, especially on FM/FM-N has totally gone and speech inteligibility is raised significantly.

If you like to remove the main PCB you can do this for the SSB TX as well,...hi.

Best 73,
Jochen (DG2IAQ)

Thanks Jochen and Mark

Now I feel we are getting down to the real "nitty gritty". Hope other owners will gain from this discussion also...

Jochen - will look forward to your further audio mods and after Mark's comments on the AGC capacitor change will be doing that at the same time. I have the INRAD 2.6 kHz SSB filter fitted (and the 2.0 Khz). I am not sure that the audio intermod distortion Mark reports is the source of the lousy audio as I cannot see a IC manufacturer would produce such a poor performance product (unless it's a real cheapy). Think it might be further back in the chain. Interesting to note your comments re the RX DSP processor and the frequency figures.

My thoughts on what has happened with this is the design engineers have concentrated on the processor and functions' parts of this rig (which are great) and have only given partial attention to the things that REALLY concern the users. I might be wrong but why are we doing all this when we never used to? Don't get me wrong, I think it's a great little transceiver and a fine concept, just needs a little tidying up and I/we are getting there.

The audio quality bit with poor THD is mainly down to a poor power amplifier stage.

I think from memory it hits something like 3% at full volume.

Use it in a quiet shack and it isn't too bad, use it in a car (possibly in excess of speed limit) and the higher volume level causes the amp to clip and distort but that is normal with some cheap audio amp IC's.

That THD is what you expect from a cheap kids transistor radio and it's difficult to get significantly better with a 12V supply. I like THD figures in the hifi quality area sort of 0.001% and better. It isn't really needed this good for a ham radio, but as noise free as possible makes life easier on the ear fatigue, and makes low signal QSO's much more practical.

As a kid I spent many years listening into the noise for long distance QSO's, and built audio kit to compress and spectrum spread the audio subjecting my ears to very poor audio quality with lots of noise just in the main audio spectrum, it hasn't done my ears much good, I have a significant drop in sensitivity just in the audio range. (At least that's the excuse I must give the XYL)

I suppose the second issue is the tiny very poor quality speaker fitted in the radio.

If you use a set of 16 or 20 Ohm headphones as some hifi quality ones are, the quality is much better.

Then after we have a clean audio stage which is easy for most people to sort, then it's time to move into the IF regions as Yochen is suggesting.

Hi Dave,

I was irked as well by the hollow sounding audio of the 897(D). I played around with various settings and found to my surprise that enabling the [DNF] (auto notch filter on main function row "p") resulted in a much more pleasant sound in all the modes (AM/FM/SSB/CW). It attenuates the hollow sounding peaky midrange and leaves the low and high end alone, kind of a fletcher-munson effect for those who like to crank up the bass and treble on their stero systems. Tune to an empty spot on the band and see for yourself. Then tune to a QSO and give it a try.

That sounds rather strange it has that much effect Rob.

I have a very slight automotive noise crackle that I use it to remove, but for me it has removed a very narrow notch and it seems to automatically find the characteristics where to place that notch, at least I didn't need to adjust anything just turn it on, it found right freq and bw.

It is strange you found the BW wide enough to notice improvements to the whole audio band or a big proportion of it's mid range. Seems possible in the absence of noise spikes that perhaps it goes wideband in search of them and hence the effect you noticed, it certainly seems to be interactive, however if this is the case in the presence of noise spikes your audio hi's and lows would not benefit.

Hi Mark,

Yes, I would agree that the result is certainly unexpected, but it is really quite effective. Most noticeable to me was when using 6 meter repeaters in my area, the 162.2 hz PL tone with the notch engaged is roughly 2 times louder than when the notch [DNF] is toggled off. I use a small full range acoustic suspension type speaker with the 897D and find that the [DNF] has quite an effect in all modes except for WFM, which of course sounds fine anyway.

The [DNF] definitely takes out the heavy mid-range peak that seems to be present in the audio response of my unit. It is very evident in SSB, AM, and NFM.

Thank you all for your interest in this subject. I have now got quite a bit of useful information from your experiences.

To summerise...

Use an external speaker (all agree)

The output IC (TDA2003) distorts at high output levels as found by Mark. This equates with the data sheet which gives the following: Distortion at Output Power 0.05 to 4.5 Watts with 4 0hm load = 0.15% (after which rises rapidly to 10%). Frequency response at 1W with same load is 40 to 15,000 Hz.

I compared this with the IC data for TDA7056B used in the PALSTAR. Output Power with THD = 10% and Rl = 8 ohms is typically 5.5 Watts. Distortion with Output Power at 0.5 is typically 0.3%. Bandwidth at -1dB is 20 Hz to 300 kHz. (full data for both these IC's is available free via web search using Part Nos).

So there is very little difference between the output amps used and it apears this is not the problem, seeing as the audio comparison between the FT897 and PALSTAR is like "chalk and cheese".

The fiddling with the audio responses prior to the audio IC using the (DNF) according to Rob tends to flatten the audio response (I think this is what you are saying Rob) and boosts the highs and lows. Looks like the audio circuitry prior to the Audio O/P IC is accentuating the midrange too much. I cannot see this happening in the RF stages especially as I am now using a Widband SSB Filter although it's interesting that Rob finds the audio is OK on WBFM.

I will now be keen to try Jochem's new mod for this area. I see this now as being "the fix".

P.S. Hope you don't break the speed limit too ofen Mark. You wouldn't get away with it in Aus any more!

You don't get away with it here much either nowadays, one of the reasons my 200MPH American muscle car stays in the garage.

It will break the law in first gear in just over 3 seconds, but whilst our limit is 70mph, you can often get away with 80 to 85. Above 100mph and you loose your license if the excuse isn't good enough. I was taught fast (safe) driving techniques by the Essex Police many years ago and 100mph was slow.

That is why I have to say my ATAS has been tested at 130mph on the local drag strip / airforce runway.

I thought though that Ausi had very long roads devoid of Police or anyone for many miles though.

I agree completely. My VERY FIRST and immediate add to the transceiver was an external commercial small "communication" speaker. Second a I designed (with a specific program) a small speaker vented enclosure (a 13 cm cube) for guesting a twin coaxial car speakers set. The results with first but more on the second change are very good indeed and push me to think that, at least owing to my modest hi-fi ears , the "distortions" coming from poorly designed AF amplifier are negligible at least on first instance.
A trial for everyone is to tune the ft897 and listen the FM broadcast band, through an external good speaker. Many times, I use the FT897 and my wooden box to enjoy music, even at hi volume without any appreciable distortion . I can say that's always far superior to many portable FM radio sets built and sold as "hifi".
Another simple trial is to connect an hi-fi earphone (also the cheapest kind works fine). Perhaps owing to fact that the the power needed by the internal electronics is so small to push the earphones, the audio spectrum seems reproduced at full.
Third, only for SSB, another free trick is to play with menues regarding the LSB and USB injection point shifts on receive.
If anybody is interested on my "cube" and wants a picture or the real measure-drawings, I'll be glad to send. 73

With car hifi you have the same problems of a low voltage supplied amplifier and lots of potential distortion and clipping.

Car load speakers are made to work well with this sort of problem, also because car speakers are often mounted in doors of back parcel shelves where there is a different air pressure on either side, the suspension on the cone is designed to work with much greater axial tolerance. This helps with a second typical cheap amplifier problem that being quite large DC components on the output, yes the outputs are capacitively coupled, but the audio is not always symmetrical which results in large DC errors that bleed away, but not without ushing the cone in one direction or another making the distortion even worse.

For this application and with it's problems a car speaker is often very cost effective, and certainly much better than the mouse speaker Yaesu use.

18970. FC40 and CAT programs

Yahoo group: FT897 (2007)
Date: 2007-06-12 08:37:31 UTC
From: oh6bi
Topic: 18970 Message: 18970

Hi All !
I have been using now one month FC40 wire tuner.
It works nicely when wire is abt 22 m long.
Now I wish to start usin CAT programs but
FC40 is connected to FT897s CAT port.
Is it possible to use tuner and CAT-program same time ?

18971. Re: RECEIVE AUDIO FROM FT897

Yahoo group: FT897 (2007)
Date: 2007-06-12 09:21:50 UTC
From: Jochen - DG2IAQ
Topic: 18957 Message: 18971

Oh dear,

today (again at QRL) while receiving the "daily digest" report on my USB stick I had a quick view over this thread.

Uuuuhhh, ..it seems to get the next "top-ten" thread ever, I have the feeling. :-) Maybe we will win a price !? Hahaha....

Due to the great response and all your interest I a new idea was awaken -- to do a revised "DG2IAQ modification sheet", only including the "Audio HIFI mods" for the FT-857/897. So to have all my actually knowledge and great results in 1 sheet only.

Just give me a few days as I'm normally too busy to do this at the moment, but when finished I will upload it to the files section here.

****
A main problem on my "mods sheets" is not only my permanent leak of time (..and finally of "menthal energy") for the hobby.
My main problem is that I would run into trouble by simply using parts or PDF partial snapshots of the manufacturers servicemanual due to copyright laws.
It would be much easier for me and for everybody as well easier to follow up to use the servicemanual areas, which are needed for the mods. With this I could do and complete a "DG2IAQ modification sheet" in less than 30% of time I actually need for taking photos by the digicam, reduce their size, optimize their quality, ...and so on).
****

And this work which I now do since nearly 5 years (officially while published on e.g. www.mods.dk) now "burns me out", as a lot of (wasted) time is spend and this could be done much easier, faster and more efficient. But the copyright law works against me. :-(

And I don't think that the manufacturer will give me an "OK" to use it like this (even as I know that some manufacturers had participated from some of my mods for future productions, ..hi).

So let's see.

As soon as I'll find the time I'll support you with the "HIFI mods".

One quick remark to the "SSB AGC time" change. I removed this on my FT-897D and I shortened it a little instead ! But this is on your personally feeling and own decision. I only like to tell you what is possible, but everybody has another personal feeling what he likes

more.
I did the "fastening" after I did the SSB AGC correction of my ICOM IC-706MK2G (on this baby the AGC SLOW is way too slow, a well known problem).
Now both (897 + 706) are QUICKLY up to max. receive sensitivity after each transmission, but just slight above "sounding too nervous".

Or let's say in short words:

- FAST (nearly no delay to come up again, could sound a little "nervous")
- NORMAL (approx. 1 sec. delay to come up again)
- SLOW (approx. 2-3 sec. delay to come up again (sounds "relaxed")

As the needed cap is on the upper side of the main PCB (YEAH !!!) you can try to find out your personally needs by just holding some caps in parallel while listening to "typically QSO situations". If you like to try the FAST version, you have to remove the cap first and hold the 0,47µF or 1µF there instead.

Best 73,
Jochen (DG2IAQ)

Hi Rami,

You can configure the Microphone socket for CAT use, it's in the
manual. I use an interface from www.g4zlp.co.uk with an adapter for the
FT897 so I can use the Mic and the CAT at the same time.

Hope this helps

>
....

You DONT's need a TNC for PSK31 CW RTTY or most other Digital modes.
You only need a TNC for things like APRS and packet,Pactor. Pactor and
Packet are not in much use any more..

For digital modes you need a computer with soundcard and an interface
for the audio and PTT lines to your radio. There are many commercial
units. I use a Microham USB Interface II which uses a USB port and
gives you CAT control in addition to interfacing audio and PTT. They
are completely Plug n Play, no wiring or soldering, they come with
cables for your radio.

If you want to do Packet/ APRS you can easily do it with out a TNC.
Use your soundcard interface and AGW Packet Engine software which is
free. This emulates a TNC in software and works great.

Topic: 18979 Message: 18979

Dudes

I have an SGC 230Pro Smartuner which I want to try with my 897. It has a preamp fitted and MUST (the manual says optional but it blows up if you don't!) have a " grounded during Tx" connection to take this out of circuit during transmit. On my base rig I just used the PTT phono jack on the back(ground it to TX / grounded during TX) but the 897 doesn't have one. Can anyone confirm if the TX GND pin on the "Linear" (and the Cat) socket is the same thing?

Regards

Kav

PS. Mark my magmounted SGC231/303 combo was inadvertently tested at quite a speed with great success. Unfortunately, thanks to some passing (as in NOT STOPPING!) brain donour it was also crash tested at around 30mph. Bits of both cars came off but the magmount didn't. Crasy days!!!

According to the manual: TX GND pin of CAT/lineair micro-DIN jack.

Not in the manual: TX REQ middle pin of ACC jack, *if* you change
the jumper close to the ACC plug.
(this may be an -897D only feature, though)

The CT-39A is a 6 pin mini din used for digital/packet. If you want ot connect your trancever to a computer you need the nine pin din. There are a fair amount of venders you there that sell that cable. I bought mine when I bought my radio from a company called RT systems. Their web site is http://www.rtsystemsinc.com/ I hope this helps

Kav

I have been going through this same thaing at the moment with my FT897 connecting it to a FL2100Z linear.

The TX GND pin 2 on the CAT/LINEAR socket is a " grounded during Tx" connection (bit of a miss-namer isn't it!) and is if fact what you are after. BE CAREFULL THOUGH. This ground is accomplished through a transistor (2SO2211-QR)which gets biased on (and hence conducts) when the FT897 is in the transmit mode. You must not exceed the current and/or voltage rating of this transistor other-wise you will be "digging" into your rig to replace it. Older equipments used to do this via a relay contact - robust and never a problem! Yaesu claims that you can pass up to 400mA of current and relay voltages up to +50V. Probably a bit optamistic!

If you wish to use the ACC jack socket you can use the RING connection to do the same thing but you WILL NEED TO CHANGE the jumper on J1027 to connect pins 2 and 3.

IT IS IMPORTANT TO READ PAGE 10 of the FT897 OPERATING MANUAL. Note: that you can ONLY SWITCH POSITIVE DC VOLTAGES.

ADDENDUM FOR THE TECHNICALLY MINDED.

To put nothing at risk (in the FT897) I made a small external circuit to increase the current handing capability and do the same job. This involves connecting a 2.2Kohm resistor to the so called TX GND pin with the other end to the Base of a PNP General Purpose Output (G.P.O/P) transistor. Emitter of this transistor to the device to be switched and the Collector to the common ground.

The transistor I use is a locally available BD140 which is rated at Ic = 1.5Amp VcB = 100V Vce = 80V Cost =Aus85cents. I switch +12V at 150ma in my application. The FT897 now only has to switch 1ma.

I am also providing an PTT output voltage source (+13.8V) to drive relays etc. using a similar set up utilising pins 1 and 2 of the CAT/LINEAR socket. No additional power source needed and currents up to the Ic rating of the transistor used. Yaesu have the supply line to pin 1 fused at 3.15 Amps!

More info if requested.

Hi Rami,

You can built interface described in April issue of QST magazine and you can use second CAT on MIC port to connect PC!

73 de Neno, 9A5AN

Hi All !
I have been using now one month FC40 wire tuner.
It works nicely when wire is abt 22 m long.
Now I wish to start usin CAT programs but
FC40 is connected to FT897s CAT port.
Is it possible to use tuner and CAT-program same time ?

>> (this may be an -897D only feature, though)
> TX gnd and TX req are NOT the same! TX req is to make the radio transmit,
> and TX gnd is to enable an EXTERNAL device, such as a linear or pre-amp.

The TX REQ middle pin of the ACC plug can be changed between
TX gnd (output) and TX req (input) by changing the jumper I mentioned.

When set to TX gnd, it uses the same transistor that drives the
TX gnd pin on the micro-DIN CAT/Linear jack.

So, change the jumper and it will do what you want; you'll also have
an ALC connection this way.

Check the schematics (the 897 service manual schematics don't have
the jumper, but the schematics that came with my -D does show
the jumper, and the jumper is on the unit I have)

Hi, Neno,

I am thinking to build the interface you designed. I'm wondering if it would be possible to modify it so that it would connect directly to a USB port rather than RS-232. I think it cold be done using an FTDI chip instead of the MAX232, but I don't know enough about IC circuit design to know how to do it. Is this possibly a modification that you could make to your design and share it with the group, or with QST readers?

Thanks

Dave

Thanks to you and all who have replied. It's starting to sound like work. All I had to do to link it to the thou' (after installing the multiple supply/control/rf cables and building a switch/connection box) was fit a phono plug! The phono was all that was actually required for the radio, the rest is for a "smartlock" unit and PC manual control of the smartuner. (The facilities were there and I have a phobia about unused sockets, tee hee).

The 897(it is a D model!) will probably rarely be used on this antenna it's just the only decent outside one I have so I'd like to use it at least once so I can test the rig properly before the waranty runs out. For the 8 months I've owned it it's been the dearest bedside radio I ever bought

I'll RTFM with the benefit of the extra info from this group and see what transpires. The bit I really don't understand is the ratings of this Tx Gnd connection. It's not powering anything. The DC feed for the tuner is sent down the multicore control cable from the main station PSU. Its just telling the preamp where ground is and to switch off if it sees it.

Guess I'll learn something one day.

Regards

OK Kav

Put simply the FT897 TX GND is through a transistor which becomes part of the external switching circuit. If the current in that circuit exceeds the current rating of the transistor the transistor fails. If you, or someone, can determine what the current flow is (without connecting the circuit to the FT897) let me know and I will tell you if any concerns. You have done well to get to the stage you are at. Pity you are not here. We could fix the whole thing in minutes. Modern technology and life's getting complicated isn't it!

18995. FT 897 noisy output in sideband mode

Yahoo group: FT897 (2007)
Date: 2007-06-10 18:07:54 UTC
From: roger_warrick
Topic: 18995 Message: 18995

I have had my new FT 897D for 6 weeks and I just realized that when in SSB, there is a data type noise on the output when I key the mic. I can turn the mic gain down to 0, and noise is still there. The processor just modifies the noise. I have gone through the idle current alignment part of the alignment procedure, and the balanced modulator, noise is still there. It is 40dB down from the carrier level which is within spec., but it can be heard by people that I am in QSO with. Is there anyone else that is experiencing this problem? Try listening to your transmit audio with another radio, and see if you have the same problem. TNX

18996. Re: Noise on transmit (SSB) - a possible solution

Yahoo group: FT897 (2007)

From: roger_warrick
Topic: 8452 Message: 18996

Alax, I tried your suggestion in turning off the DBF to eliminate the noise in transmit. I monitor my output with a Motorola Service monitor, and the noise is still there, but the sound changes. It now sounds like hash instead of some kind of data. It would be nice to have a fix that would eliminate the noise completely. On my 897D the noise is 40dB down from the carrier which puts it within spec., but when the band is clear, the ham that I am in contact with can hear the noise. Not a good thing for a radio that is supposed to be so good. Roger--- In FT897@yahoogroups.com, "whynotbecreative" <kg4ecv@...> wrote:

From: nitomanito
Topic: 18997 Message: 18997

Hi hams!

I think i have a problem with my CAT connection. When i retune from Ham Radio Deluxe my FT-897D i listen a "tick". This fact had not been a problem for me until i have tried to work with satellites. The software retune quite often and is impossible for me to listen the "waves", i only listen "tick tick tick ..."

So, is there anybody who was able to kill that "tick".

Thanks in advance, sorry for my english.

From: Denny
Topic: 1117 Message: 18998

Wayne,
When you see the INIT the antenna is initializing the antenna with the radio. It usually takes a few minutes to get thru the process. Once it complets you should see ATAS where INIT was. Once you see the ATAS you antenna is ready to tune. Hope that helps out.

18999. Signalink USB + MMTTY no transmit

Yahoo group: FT897 (2007)
Date: 2007-06-13 02:01:00 UTC
From: Herbie223
Topic: 18999 Message: 18999

Hi all:

I am using a Signalink USB + 535 mhz PIII running XP Pro + 897D.
PSK31 Digipan will transmit and receive with no problem.

I am attempting to run MMTTY. I can recieve. I can NOT get the
software to key the radio. Program goes to transmit mode, but the
PTT light does not come on on the interface and the radio does not
transmit. It appears that I have the program set for AFSK opperation.

A curiostiy is that the mixer device properties in XP keep reverting
back to the computer sound card when MMTTY running.

Anyone have any suggestions?

Thanks. 73

Topic: 19001 Message: 19001

Hello

I received two FT-897D's. Both have low power TX power output on HF.

I sent the first one back to HRO, and they were great about sending another. And that one has the same problem. The second one is going back to Yaesu. And my buddy owns one to. And has not been able to use his. He has a low power TX problem to. SO I spent over $1000 for a radio that is in transit more than we are able to use it.

You don't get away with it here much either
nowadays, one of the reasons my
200MPH American muscle car stays in the garage.

It will break the law in first gear in just over 3
seconds, but whilst our
limit is 70mph, you can often get away with 80 to
85. Above 100mph and you
loose your license if the excuse isn't good
enough. I was taught fast (safe)
driving techniques by the Essex Police many years
ago and 100mph was slow.

That is why I have to say my ATAS has been tested
at 130mph on the local
drag strip / airforce runway.

I thought though that Ausi had very long roads
devoid of Police or anyone
for many miles though.

Yes you can repair atas120 antenna with not to much problem, I have repair mine 3 or 4 times myself. most of the time they just fill up with water and you have to Take them apart to clean them. rise with elctronic cleaner. And sometimes someone will reach up and twist the top section and brake the main gear which can be replaced or Repaired with Loctite Super Glue(ADVANCED BONDING SYSTEM) Part # 01-34925-01 It is the only type that holds up to the load's thats applyed the gear. Clean And lube the all-thread Check for Binding on treads must be able to move with no effort . I give this repair job a 3.5 out of 5 with 5 being the hardest. the main thing is getting a long wall papper tray to disassemble ATAS 120 into to catch the 3 ball bearing and clips and screws. Find The Brake down Pic To Aid you on the Antenna it helps on the 1st time.

This is the time of year when I spend most of my time on 6M and 2M. There wasn't much 6M propagation on the west coast for last weekend's VHF QSO Party, but I did manage a 300+ mile 2 meter contact into southern Oregon from CM87 to CN82. Besides the FT-897D I was using a 5 element log periodic (Elk dual-band) @12ft and a TE Systems 200 watt amplifier. I was pretty startled when the guy called me. As good as that was, 5-land is way out of reach for me...

Hello, my name is Roger and my call is K2CP. I am new to message boarding, so please bear with me. I purchased my FT 897D in April, 2007, and I think it is a fine radio. I do have the "digital noise" in transmit on SSB issue. Through this discussion group I have learned how to reduce the level to well within spec. It is not hard to do, but takes some planning and a steady hand. Myself and some close friends of mine have just initiated a casual rag chewers net on 75 meters, 3.888.88. I would like it if anyone with the FT 897 would join us. We meet evenings at 10:30 EST. We talk mostly about radio, but touch on a variety of other topics as well. One of my friends is Mal, NC4L who is the world's expert on the FT 102. Looking forward to hearing from you, Roger.

Hi Robert,

if you are a little in projects construction, you can probably build
an interface yourself for +- $20.
We built about 20 at our radio club.
You can find the diagram at page 21 of this document.
http://www.ham-radio.ch/doc/Interfaces.pdf

Good luck

From: Andy Digby
Topic: 18980 Message: 19011

Lets try that again.

9 pin serial port wiring is 2,3 & 5.

2 & 3 = tx / rx and 5 = gnd.

If it does work oneway swap 2 & 3.

Hi Roger.

Pse. have a look at www.mods.dk. There's a new fix from an italian HAM operator.

He added a simple jumper/wiring to set the DSP GND to the common GND of the rig and the noise goes down. At the same time lots of RX birdies also go away.

I did it on mine FT-897D as well and it works.

Original Message

Hi All,

I have an almost brand new FT897D and have found that the Transmit is
staying on even though I have released the PTT button on the Mic.

Have been told by a good mate that it is because of bad SWR and also
no Grounding of the rig etc..

Any opinions?

Thanks.

A known problem with RF getting into the rig, for example with the MH59 mic and an HF pack operation, I often have this problem. In my applications, switching back to a stock mike helps, and sometimes resonant radials, check it on a dummy load an see if the same thing happens, if not, its probably RF/poor ground-related. 73, Scott

It is more likely staying in transmit due to the VOX function being turned on, or your having some other device connected. Are you connected to any other devices, such as a key, or computer? Does the radio transmit by itself, when you make noise near the mike? 73, KC3VO-Bob Curry

How are you measuring the power? (Hopefully, into a good 50 ohm dummy load, in CW or FM mode, while powering from a good external 13.8 volt 25 ampere or more regulated power source, and using a good, accurate wattmeter.) It is NORMAL to see only 30-40 watts output if you attempt to measure SSB voice power output with a CW type wattmeter, as it cannot accurately read PEAK SSB POWER. if using internal battery power, 20 watts is normal on FM/CW.-73, KC3VO-Bob

From: mrmsudawgs
Topic: 18997 Message: 19018

Try changing the baud rate of the port you are connected to. I had mine set on 14,400 and noticed the clicks you are referring to. Someone suggested changing the baud rate to 9600 which is slower but well within our needs in the Ham world. This reduced my ticks to a nearly inaudible level. I too use Ham Radio Deluxe.

Note, you'll need to change the baud rate for the serial port by changing the settings in your computer first THEN make then make the same change in HRD. Changing it only in HRD will cause a communication's failure. I believe you change the port speed for your computer with the Device Manager withing Windows.

Search this forum for your problem. You will see many posts and suggested solutions.

19019. Re: [FT897] Setting up PSK31 or DM780

Yahoo group: FT897 (2007)
Date: 2007-06-15 17:25:29 UTC
From: James Wilson
Topic: 18764 Message: 19019

Seriously someone should right a FAQ on this, it seems easy but it isn't.

There is a section in the manual for PSK, you need to read this section.

Enable digital for USB.

Configure HRD (Ham Radio Deluxe) to use the sound card for PTT.

ALWAYS ALWAYS ALWAYS Check your ALC when transmitting. Adjust your transmit volume until your ALC meter reads zero then turn it just a little bit less. Check power and modulation to ensure your volume is high enough. If you need more power set menu item 75 higher. ALC is your enemy when it comes to PSK. Check your ALC each session and every time you change bands. Not overdriving your transmitter is the easiest and most important thing you can do while using PSK and other digital modes.

If this isn't enough to get you started let me know and I will look at my settings and get you some more detailed information. I have the same setup as you do. If you want personal help email me and I will send you my cell phone number, I will be around tonight.

19020. Re: [FT897] No 40m power?

Yahoo group: FT897 (2007)
Date: 2007-06-15 17:32:34 UTC
From: Lew Phelps K6LMP
Topic: 19008 Message: 19020

Is this just on 40 meters, or on all HF bands? Also, what modes are affected? Will it transmit in CW, AM, SSB, etc. or are all modes dead?

Initial things to check:
1. if in LSB, you need to input sound into the mike (a humming sound or whistle). Otherwise, no output.
2. Antenna connection: if the rig is seeing a very high SWR either from a shorted or open antenna connection, it will not transmit.
3. Mike connection. If it will key in CW mode, there's probably a problem with the mike or PTT circuitry, though it would seem weird that it would only affect one band.

Hi Herb,

It's been a while since I played with MMTTY...but as I recall, I had to go into the Options / Setup MMTTY / Misc settings and play with the Device ID so it worked with the right sound card. Unfortunately, it is a cryptic -1 to +3...so I had to use the GAT method....guess and try...until it worked.

MMTTY is a great little piece of software...just haven't had time to use it in a while...and the SignaLink USB is running on another computer now that doesn't have MMTTY installed...so the above is all from fallible memory access...but hope it at least serves as a clue.

Good luck,

The main issue is getting your program to use THAT sound card and not some other one. Once you're over that hurdle, the thing works pretty much straight up. They say to set the transmit level to just below the threshold where the ALC starts to kick in.

And you can set the RX level using the spectrum display in most software.

Hi Lew,

Is good idea for interface ver.2 but I am so busy now with commissioning of termal power plant on SV9 even to think about it.
If you don't have serial port on your laptop, very cheap solution is USB to RS232 converter which you can buy in every computer shop for few $.

Subject: Re: [FT897] FC40 and CAT programs

Hi, Neno,

I am thinking to build the interface you designed. I'm wondering if
it would be possible to modify it so that it would connect directly
to a USB port rather than RS-232. I think it cold be done using an
FTDI chip instead of the MAX232, but I don't know enough about IC
circuit design to know how to do it. Is this possibly a modification
that you could make to your design and share it with the group, or
with QST readers?

Thanks

19033. Filter mod to use CW filter in SSB mode.

Yahoo group: FT897 (2007)
Date: 2007-06-17 04:03:29 UTC
From: ki4hlw
Topic: 19033 Message: 19033

I want to use my W4RT 500hz filter for RTTY work with my Rigblaster, but as you know it won't let you select this filter in SSB mode. I also read how the radio tells which filter is in the radio by which pin is grounded, and you can fool the radio into letting you name the filters yourself, but I can't find a good set of directions how to change it or a diagram of which pin is which number. I won't mind cutting or adding a trace or jumper to the filter if I know exactly what to do.

Can anyone give or point me to a good set of directions to do this? pictures a definite plus. I prefer a response to the forum, but you can send me pictures directly if you have to.

Thanks in advance.

Brian, KI4HLW

Why not run RTTY in DIGI mode as the rig is designed to do? In that fashion the rig can use all of the narrow filters with a center frequency of 1000hz. It works superbly; I do all of the digital modes this way using the Navigator interface with FB results.

Hi there thanks for the comment.
The Mic is set to NOR on 059 Mic sel and is in the on position in
menu 058...
Still they dont work

Any help is most appreciated

Neno, thanks for your reply. I completely understand about the
demands on your time.

I have a Keyspan USB-RS232 converter dongle; I was just thinking that
I could clean up the installation (one less device) by putting the
USB conversion on the board,

Thanks for a great idea. I am actually building the project, with an
RS232 output to DB9, right now.

Have you checked the jacks. Sometime one of wires gets bent so it
doesn't align with the contact on the cable.

Hello

Thank you for responding to my post. I have had 2 new 897's and my friend has one to. And we all have the same low power output and a HSWR light. This is how I was able to test.

I checked this radio on a good 20 meter dipole and a Daiwa cross needle power meter, and I also checked this radio with a 60 watt light bulb dummy load. On the antenna the VSWR was less than 1.3/1 and I only saw 25 watts output. On the light bulb I saw a 1.1/1 VSWR and 35 watts output. On both these loads the reading should have been a full 100 watts output.

With the antenna and dummy load I was getting a HSWR light and low power problem,. I was in CW mode to to these tests.

Both the antenna and the dummy load presented a near perfect SWR and yet the radio flashed a HSWR light and folded back power.

How are you measuring the power? (Hopefully, into a good 50 ohm dummy load,
in CW or FM mode, while powering from a good external 13.8 volt 25 ampere or
more regulated power source, and using a good, accurate wattmeter.) It is
NORMAL to see only 30-40 watts output if you attempt to measure SSB voice power
output with a CW type wattmeter, as it cannot accurately read PEAK SSB POWER.
if using internal battery power, 20 watts is normal on FM/CW.-73, KC3VO-Bob

Wayne,
When you see the INIT the antenna is initializing the antenna with the radio. It usually takes a few minutes to get thru the process. Once it complets you should see ATAS where INIT was. Once you see the ATAS you antenna is ready to tune. Hope that helps out.

You're doing nothing wrong. When you have the FT897D set to ATAS mode
it will not transmit on 80 M or 160 M since the ATAS 120 is spec'd for
40 M up.

With three radios exhibiting the same fault, it is time to suspect
your test method.

Before doing anything else, please check the radio with a PROPER
100W (or more) rated 50 ohm dummy load (beg, steal or borrow). You
cannot be sure that an aerial or a lamp load exhibit a constant 50
ohm load and this may well be the cause of the problem. Check your
output power on CW or FM.

You are attempting to tune on 80 meters! (That is what is wrong)--The ATAS series antennas do NOT operate, or allow tuning, below 7.00 Mhz on the associated YAESU radios. This type antenna is NOT designed for 60, 80 or 160 meter operation, so when the radio is properly configured, all transmit functions below 7.00 mhz are disabled. 73, KC3VO-Bob Curry

Hi all

Update

Ive done another factory reset and it all worked ok as it should...
I then added in all the menu settings into the menu which i had the foresight to write down prior to reset..and it stopped working so I had a good look at the changed values from factory reset and my saved list....
I came across menu number 26 (cw paddle) This was set to mickey...i changed it to elekey and the up and down worked again.

I'm now a happy bunny with some egg on my face with a heck of a lot of frequency to reprogram...lol

thanks for all your comment

Ian

With three radios exhibiting the same fault, it is time to suspect
your test method.

Before doing anything else, please check the radio with a PROPER
100W (or more) rated 50 ohm dummy load (beg, steal or borrow). You
cannot be sure that an aerial or a lamp load exhibit a constant 50
ohm load and this may well be the cause of the problem. Check your
output power on CW or FM.

From: James Wilson
Topic: 19001 Message: 19058

I have only been a ham radio operator for a short amount of time but here are some causes of high SWR that I have experienced with dipoles.
Cable issue
loose cable
improper ground
close proximity to other metallic objects
reflection of signal
using a dx sloper as a dipole
Tuner out of tune
very high noise or other nearby transmitter

That's all I can think of now but I am sure there are more.

A "Good" 20 meter dipole will give poor SWR if it is installed too close to something, or if the feedline or connectors have a problem/poor connection. You must use a proper, R.F. rated, 50 ohm, non-inductive dummy load to be reasonably sure of radio performance. (There IS a REASON these R.F. type dummy loads are somewhat expensive.)--73, KC3VO-Bob Curry

Check to see if you can trade the ATAS for the LDG AT897 tuner. it will tune 160 to 6 meters, plus mount to the radio for a compact package.

Hello Frank,

I would recommend connection of the ALC. If you use the ACC jack on the back of the rig (FT-897) connecting both the PTT and ALC is quite easy.

Hi All
I just got a 897 used and find the manual just a bit lacking on some info. What happens if you have both A and B batteries installed and hook up the DC power cord to the back of the radio. Will you have any problems? Will it still default to the 20 watt output power or the 100 watt power output? Will the batteries charge from the DC input or only from the CD-24 charger. The learning curve on this rig is tough and the yaesu manual is not clear on some things. Is there a better book some where like a FT-897 for dummies?

Hope someone can help!

Hello

Thank you for responding to my post. I have had 2 new 897's and my friend has one to. And we all have the same low power output and a HSWR light. This is how I was able to test.

I checked this radio on a good 20 meter dipole and a Daiwa cross needle power meter, and I also checked this radio with a 60 watt light bulb dummy load. On the antenna the VSWR was less than 1.3/1 and I only saw 25 watts output. On the light bulb I saw a 1.1/1 VSWR and 35 watts output. On both these loads the reading should have been a full 100 watts output.

With the antenna and dummy load I was getting a HSWR light and low power problem,. I was in CW mode to to these tests.

Both the antenna and the dummy load presented a near perfect SWR and yet the radio flashed a HSWR light and folded back power.

How are you measuring the power? (Hopefully, into a good 50 ohm dummy load, in CW or FM mode, while powering from a good external 13.8 volt 25 ampere or more regulated power source, and using a good, accurate wattmeter.) It is NORMAL to see only 30-40 watts output if you attempt to measure SSB voice power output with a CW type wattmeter, as it cannot accurately read PEAK SSB POWER. if using internal battery power, 20 watts is normal on FM/CW.-73, KC3VO-Bob

19083. Yaesu manual omissions

Yahoo group: FT897 (2007)
Date: 2007-06-19 03:38:29 UTC
From: kb7scv
Topic: 19083 Message: 19083

I am new to the group and hope those with more knowledge on the FT-897 can help. The manual is not clear on a lot of things. I have just got a set of FNB-78 batteries and CD-24 charger. After installing the batteries can you still run on a external power supply with the main DC connector on the back, or must you run only on the batteries? The battery limits the radio to low output, 20w. If I power up on the base power supply will I get 100w again? Will the rig switch back to full out put power or will it damage the radio?

Thanks
John / kb7scv

19084. No power output on VHF/UHF

Yahoo group: FT897 (2007)
Date: 2007-06-20 01:11:22 UTC
From: vo1rjm
Topic: 19084 Message: 19084

Hello All,

FT-897,
no RF power output on VHF/UHF, any mode. With external watt meter inline, I see about 0.5W forward. This does not change no matter what the RF power setting is set to in the menu.
When push the PTT, TX light is red, but no RF power output.
HF is working fine.
I have tried the HOME + power on as to reset the processor.
I know the antenna is fine, tested it with other radio.
What could be gone wrong, what compondent is likely to fail on the PA-Unit.

Thank-you in advance

19085. Re: [FT897] No power output on VHF/UHF

That looks like RF in the Shack. The 897 seems to be a little sensible with that. I have that problem on higher
Output but only with my 897, not with my Kenwood TS-480. Check your Antenna System and do proper
Grounding.

The Software Mod did not work with newer FT-897. Yaesu changed something. You have to do the Solder
Mod. Look at www.mods.dk.

Just went throught he same issue with mine, a quick search of the
messages here on the group would have found the post and few others
relaated tot he same thing. More than likely your final transistor is
fried. check with www.hamrepair.com they had mine repaired and back
in 2.5 weeks and cost @ $180.00 total for the repair and shipping

19090. Re: Power options

Yahoo group: FT897 (2007)
Date: 2007-06-20 14:08:55 UTC
From: George
Topic: 19074 Message: 19090

If you connect power thru the connecter on the back of the radio it will assume that you are either running a PS or a large battery pack and default to the max-100w output. If that power is off and it reverts to the internal connectors you drop down to the max-20w output.

The batteries are not charged unless you use the special charger or equilivent pluged into the back of the unit. You can get some 3rd party charges for less than the OEM price.

I am not sure any any specific books.

I believe the widebander program will only work with the non D version
of the 897. You will need to make the jumper change mod to wideband
the 897D version as is specified in several places in the file section
of this site.

19098. For sale

Yahoo group: FT897 (2007)
Date: 2007-06-21 22:05:10 UTC
From: Leandro Sucet
Topic: 4424 Message: 19098

I have for sale my YAESU FT-897D S/N 4J400194. I am the only owner since i got it from HRO in PHOENIX,AZ.

At that time they put for me the 2.3 SSB filter, (NO CW filter). The radio went back to Yaesu before the warranty end to have it checked and at that time they did some AM update. I think that they replace a transistor or resistor something like that. I have the sheet they sent me back with the rig and it should be in my files. Beside that the radio has no problems and never been mod. I always get good reports with my YAESU MD-100 MIC, that it is included in this deal. Also the radio have the internal POWER SUPPLY FP-30 that came with the rig from HRO. I ordered all together. I also have the LDG external S-METER that it is included.

For price you can e-mail me at lnaelis@...
Or you can reach me at 505-259-8037

Regards Leandro AD5XL

19099. Re: 6M SELF OSCILLATION

Yahoo group: FT897 (2007)
Date: 2007-06-21 23:12:45 UTC
From: Rob, WB1AEX
Topic: 19094 Message: 19099

One thing I would check Florentin is to open the rig up and snug down all of the philips head mounting screws that fasten the mainboards to the chassis. This must be done to the receiver board as well as the exciter power amplifier board.

Then check to be sure that the screws that fasten the final amplifier transistors to the heatsink are tight.

I have found that the screws in my radio will slowly loosen up over time as a result of the thermal cycles. When they loosen up, the run-away oscillation symptom appears due to poor internal grounding. With my rig, the oscillation is first apparent on 6 meters. If I don't take care of it, it will take off on the HF bands shortly after the behavior shows up on 6 meters. After tightening, the rig is good to go for another 6 months or so! After the last episode, I inserted split ring lock washers under the screws. Hopefully that will be the end of it!

Hope this resolves the issue for you.

Rob WB1AEX

Widebander works on the D version, it has to be one of the first batches as Yaesu seems to have changed the firmware.
My 897D is opened using widebander and sometimes I use other software that I cannot remember the name.
Yaesu somehow protected the new radios. The only solution for now is the solder ball mod.

Current consumption may reach as high as 20 to 22 amperes during full power FM or CW, and SSB peaks will also be around 20 amperes. A mechanical meter will not accurately read the SSB peak current, as the peaks are generally short duration. Amperage used will vary, from band to band, and will vary with antenna loading/matching. The power source used should be capable of at least 22 amperes at 13.8 volts D.C. for best results.--73, KC3VO-Bob Curry

There is a multi-function button labeled "Spot" that you can push ... It is button "A" on the Multi-function "J" position

Also, in CW mode, the frequency on the display is your actual CW carrier freq,
and you can tune the receive signal until the "CW-T" LED (at the 10 O'clock position above the main tuning dial)
Blinks on the received CW signal. This will indicate that you are zero-beat with the other station's CW carrier ..

Hello All,

I tried to get 2 FT 897D's to work. I live in a small apartment and the antenna is close by. Neither radio worked. IT would flash a HIGH SWR light and fold back power. When the SWR was near perfect. This would happen on outside antennas and mobile antennas. Yaesu stated that this is because of the High RF field and the radio WILL not work, They had no fix for this, and they would refund my money. HRO NEW England did that. I am not happy with this answer. The radio is small and no where does it state that the radio would not work in a strong RF area. Like at field day or at a park or beach or camping where the antenna is near by.

I would like to make Japan aware of this. And see what the truth is in this matter. I trusted Yaesu as a good piece of equipment and it turned out to be junk.

So if you are having problems with your 897 like another of my friends is having problems. Maybe you should seek your money back.

HELLO !! I believe that this is an ' exception to the rule' , NOT 'par for the course' . I live in an apartment and operate 6 meters every day and 20 meters on occassion (the antenna is less than 10 ft away) . Sure , I had to use a few clamp-on rf chokes as well as open up my 897D and resolder the antenna connectors as well as perform some of the AGC and audio mods , but this was improvements to an already exceptional piece of gear. I also operated my 897D several weekends ago , all weekend for the ARRL VHF Contest from a remote central Minn. farm location and was very pleased at the rig's stand alone performance. Please do not discount your 897 for some high RF field performance problems encountered - ALOT OF XCVRS HAVE THESE KIND OF PROBLEMS..... I am very glad that Yaesu did refund the monies for this gentlemen , but don't get rid of your rig just yet - Use a bit of common sense while operating these rigs in your enviroment..... 73, Ron Bergantzel KA0RYT

Topic: 19109 Message: 19111

The radio by legal design for sale in the EU has to work in a 3V/m environment, Yaesu actually test it to the next grade of 10V/m susceptance. In many commercial test applications due to uncertainties in the test this field strength will quite substancially be exceeded often as much as +6db just to be safe, so the radio will probably work well above 10V/m.

The legal tests are all above HF, but Yaesu also test with these field strengths down into the radio's operating bands.

If your running it in a field strength that is too powerful for the radio to work properly, your probably not far off your safe environmental level for your health.

I have run mine as a remote monitor, receiver only in a field of over 60V/m (antenna signal attenuated to avoid frying front end) and it never faulted.

Yaesu may well have done you a favour.

You need to be very careful when working in close proximity with strong RF fields, or all sorts of nasty health issues will start to happen.

Subject: [FT897] My money was refunded.

Hello All,

I tried to get 2 FT 897D's to work. I live in a small apartment and the antenna is close by. Neither radio worked. IT would flash a HIGH SWR light and fold back power. When the SWR was near perfect. This

would happen on outside antennas and mobile antennas. Yaesu stated that this is because of the High RF field and the radio WILL not work, They had no fix for this, and they would refund my money. HRO NEW England did that. I am not happy with this answer. The radio is small and no where does it state that the radio would not work in a strong RF area. Like at field day or at a park or beach or camping where the antenna is near by.

I would like to make Japan aware of this. And see what the truth is in this matter. I trusted Yaesu as a good piece of equipment and it turned out to be junk.

So if you are having problems with your 897 like another of my friends is having problems. Maybe you should seek your money back.

> Clair K7IE

I follow both the FT-857 and FT897 groups. I see the 6m oscillation issue discussed regularly on the FT-857 group, but not the FT897 one. I've gathered that at least one cause of the oscillation was due to the routing of an internal coax that is in a different location in the 857 than in the 897. It also appears that Yaesu correct the issue in production a while ago, and, in many cases will work to correct it in radios even if they are out of warranty.

There was another problem on 6m reported recently on 857s that had some similarity to the oscillation, but appears to be limited to a small batch of radios and appears due to an idling current being set incorrectly from the factory. Yaesu was reported to be fixing the radios with the problem.

hello mike

well i'm very happy with my 897D i live in an area with 2 cell phone
towers within 400m one is from the netherlands and the other one is in
germany 200m form here i use a long wire antenna on shortwave and a
v-2000 diamond on 2/70 and the radio works normal no problems with
flashy swr readings the tuner used on the long wire wich is grounded
and connected throuhg a 1:4 un-un is a fc-757at also from yaesu

and after 2 years i am still very pleased with the rig
so there is no problem with big rf here

19114. FT-897D SSB TX Audio - Bias Adjustment

Yahoo group: FT897 (2007)
Date: 2007-06-22 21:12:36 UTC
From: Kerry Winer
Topic: 19114 Message: 19114

I was wondering if anyone has any experience with the TX bias adjustment in the FT-897D. I have several of these radios. They all work fine and have a harsh, almost distorted sounding SSB transmiiter. I happened to check the bias adjustments for the predriver, drivers, exciters and PA's and found that they were less than specified in the FT-897D service manual. I was wondering if it would be a good idea to bring bias up these devices. Normally, from my experience, when you bring the bias up on these stages it smooths out the TX audio roughness. Hopefully it will result in a smoother, fuller sound.

Does anyone have any experience with the TX bias adjustment? (Recommended values for bias current would be greatly appreciated) The values in the service manual are very conservative and are probably recommended to alleviate overheating. I would like to tinker with these adjustments to see if the TX SSB audio can be improved. Any input on this subject would be greatly appreciated. 73, Kerry K8KSW

I run both an Ft-857 and Ft-817 in my shack....All my coax run outside in a common pvc tube from the room through the attic and outside, and both antennas are not far apart at all..
I use the 857 mostly for APRS activity and it beacons continuously, and use my Ft-817 for my hf qrp rig, and neither one affects each other. In fact when running the 857 for hf propnet I can still utilize my qrp rig without hash or problems.

From: Mark Vaughan
Topic: 19114 Message: 19116

Yaesu always seem to get these wrong, bringing them up to the service manual settings realy improves the audio TX and drops the harmonics.

I've adjusted loads of 857's and 897's to service manual spec's.

Yochen DG2IAQ has pushed the bias settings much higher and claims better results again, I think he's preparing a better report on this at the moment, but do a web search under DG2IAQ and you'll find his web site where he goes over the spec's for the driver stages and the bias he is using.

Hello there.
I live in an apartment at ground level, practically no outside room at all. So my antenna starts basically right next to the radio through a home made antenna tuner. If you touch the radio during transmission you burn your fingers on all the HF bands. No possible way to fit a good ground system, there is simply no room.
However the FT897D performs completely flawless in every regard. So I believe that you did do something seriously wrong in your installation. Best 73's

Kerry
After getting lousy audio reports (some saying typical of a FT897)
I adjusted my FT897 transmitter driver and PA bias levels to those
suggested by Yochen DG2IAQ and, according to reports from local
stations, it has cleared up and improved the SSB audio quality.
Don't know about the harmonics, havn't checked them but they have
not been a concern, as far as I am aware. Well worth doing!

I still can not really understand your problems. I used my FT897D in a pick nick area just sitting on the table, a wire tied up to the next tree, no ground at all matched through my coupler. Perfect all the way around. However I noticed that the common SWR meters seem to indicate a very low SWR if the wire was attached directly to the rig, The rig then of course folded the power back and showed a very high SWR. The only meter which gave a correct indication was a Bird SWR/power meter. All the others indicated low SWR not what actually happened. I tried 4 different cheap SWR meters, all were completely wrong and gave low SWR readings. Whereas the Bird showed SWR in excess of 10. So please don't trust the cheaper meters to much. Heavens only know what they will show.

19121. Re: [FT897] Re: My money was refunded.(Possible difficulty)

Yahoo group: FT897 (2007)
Date: 2007-06-23 14:07:06 UTC
From: kc3vo@aol.com
Topic: 19121 Message: 19121

After a lengthy conversation, I came to the conclusion that it is likely this difficulty arose because of a DEFECTIVE SWR METER! The SWR meter showed a less than 1.5 to 1.0 SWR match into a 60 watt, 120 volt lightbulb. A 60 watt 120 volt lightbulb has a working resistance of approximately 240 ohms, which is equal to an SWR of about 5 to 1 in a 50 ohm system. (With the OLD vacuum tube radios, a light bulb WOULD often work as a load, due to the tube type output having a ADJUSTABLE "Pi NETWORK" tuning section, which could match other than 50 ohm loads) -NOT the case with the FT-897, which has a FIXED 50 ohm output. At less than full brightness, the lightbulb would have lower resistance, but the meter SHOULD have shown at least a 3 to 1 SWR! Use of this SAME defective meter and "lightbulb dummy load" to set up stations by both parties involved, would lead to the (possibly erroneous) conclusion that the radios were defective. With use of a bad meter, it is possible that the ANTENNA SWR was also not correct. I suggested that a different meter be used, and that a solid-state radio of different manufacture be tested in the SAME setup. It seems the operator, with good intentions, was misled by defective "Test Equipment" What next? who knows!----73, KC3VO-Bob Curry.

Jurgen:
It's not a matter of "ground" but rather counterpoise. To be more correct, it's the other half of the antenna. As such, don't just use a single wire connected to your tuner without anything else connected or your radio and you will be the other side of the antenna (as you noticed). You should try using some kind of balanced antenna configuration. Suggestions are a pair of slinky's hung on the wall. You can use clip-leads to bypass as many turns as you need to tune the antenna approximately where you want to operate. Another is to simply use a pair of equal length wires of whatever length you can get out where they're as far away from anything electrical/conductive and mount your tuner at the center between them. When you do this, be sure to "decouple" (choke RF) the transmission line and any control cables to the tuner using some kind of ferrites. This will prevent RF from coming back down the transmission line and control cables to the radio (since you will never end up with a truly balanced antenna inside as there's too many interfering factors).

Hello Charles.
I do agree completely with what you say. I have of course all leads to the controlling computer isolated with ferrite cores. Its only the radio which is hot. Originally it gave some problems to the mike and key input but a couple of toroids clipped over the leads and all was ok. No, I never had problems at all. Apart from that I burn my fingers touching the Ft987d. But this is ok as far as I am concerned as the tuning and controls are done by my computer. I have to explain that I am a PHD in Comm. Engineering, I know exactly whats happening and it does not bother me. I just don't touch the FT. But my submission was an answer to a complain that the FT987D does not work in a strong RF field. Its simply not so, it actually works very well if all incoming leads have RF suppressors fitted. But thanks for your remarks they might be very handy for somebody. There are too many people who blame the poor radio if the problems might be something completely different. I just run it into my tuner, resonate the whole system to the frequency used and go ahead, there is so much RF on the radio that a fluorescent tube will light up touching the rig. I know its completely unprofessional the way I use it, but it work very well indeed on all the HF bands.

Your working way outside your safety levels.

We presently live in a world where the public are frightened of any transmitter no matter how safe it might be, through great effort we have managed to keep public fear away from the ham radio scene.

It's idiots like you that are going to loose us our hobby. Personally if I were the local authorities I would revoke your license.

hello mike

well i'm very happy with my 897D i live in an area with 2 cell phone
towers within 400m one is from the netherlands and the other one is in
germany 200m form here i use a long wire antenna on shortwave and a
v-2000 diamond on 2/70 and the radio works normal no problems with
flashy swr readings the tuner used on the long wire wich is grounded
and connected throuhg a 1:4 un-un is a fc-757at also from yaesu

and after 2 years i am still very pleased with the rig
so there is no problem with big rf here

Could this have maybe have been written with greater civility?

I do however agree that something is amiss. I have been in ham radio
for over 40 years with all manner of gear. I have never seen,
experienced, or until now ever heard of a situation in which one could
get an RF burn by touching a radio like that. Something is absolutely
not right. I'm no engineer but you don't need to be to know that.

Hi Bob

Glad to hear it's probably not the rigs. You're not the only one to be skunked by faulty equipment. I have a rule if results seem wierd, check the cables, everything, then re-test.

Subject: Re: [FT897] Re: My money was refunded.(Possible difficulty)

After a lengthy conversation, I came to the conclusion that it is likely this difficulty arose because of a DEFECTIVE SWR METER! The SWR meter showed a
less than 1.5 to 1.0 SWR match into a 60 watt, 120 volt lightbulb. A 60 watt
120 volt lightbulb has a working resistance of approximately 240 ohms, which
is equal to an SWR of about 5 to 1 in a 50 ohm system. (With the OLD vacuum
tube radios, a light bulb WOULD often work as a load, due to the tube type output having a ADJUSTABLE "Pi NETWORK" tuning section, which could match other
than 50 ohm loads) -NOT the case with the FT-897, which has a FIXED 50 ohm output. At less than full brightness, the lightbulb would have lower resistance, but the meter SHOULD have shown at least a 3 to 1 SWR! Use of this SAME
defective meter and "lightbulb dummy load" to set up stations by both parties
involved, would lead to the (possibly erroneous) conclusion that the radios
were defective. With use of a bad meter, it is possible that the ANTENNA SWR
was also not correct. I suggested that a different meter be used, and that a
solid-state radio of different manufacture be tested in the SAME setup. It seems the operator, with good intentions, was misled by defective "Test Equipment" What next? who knows!----73, KC3VO-Bob Curry.

Mark.
I am now 71 years old and in perfect health. Practically all my life I worked in extremely strong RF fields, I am talking about multi megawatt transmitters. The only time I ever had some problems was as I forget to remove my car keys and got a very nasty burn in my pocket as the keys literately went red hot. This was right underneath the antenna system at Northwest cape. So I do not believe any of the so called RF hazards. Sure they might and probably do exist on microwaves which can and do penetrate the human body, but as I worked only on short wave and VLF transmitters nobody bothered about safety measures at least during my working days, apart from removing all metal objects from your body. All this trouble and fear about transmitted RF started only in the last 15 to 20 years. I believe many people have nothing better to do then looking for problems. I do live alone, so nobody else can possible be affected. But this was not the reason of my submission. My submission was to point out that the FT987D does not seem to be affected by strong RF fields. I also have Icom and Kenwood units here, they are indeed affected and go haywire.

Trouble is Roger I see this again and again and again.

Two operatives in my county working from caravans and flats with internal antenna's suffer temporary blindness for several weeks through too much RF.

If you touch the kit and it burns you, you shut it down and investigate, you don't say 'Oh what the hell I live in a small flat so there's nothing I can do'.

Virtually every authority throughout the world that examines and license Ham Radio operators will teach about the safety levels, but it seems too many people choose to ignore this.

You can get RF burns of a 1W CB radio, I know done that as a kid, as a ham radio operator you are licensed to play with power levels that can easily be lethal, and you are supposed to observe the laws for health and safety.

I'm sorry it appeared I was so hard, but we are not getting the message through, if things like this continue, then it won't be long before the person next door suffers directly related health problems and the Gov't takes draconian action and bans the lot, the Gov't and public being even thicker.

I regularly argue with Gov't and Public that don't want a mobile phone mast 100 yards down the road from their school when they all carry mobiles in their pockets emitting 10 times the radiation levels, and they are suceeding. We are presently moving into a fear factor on wireless networks.

I was a proud Top level Pistol shooter in the UK having met the qualifier to go to the Olypmics, the action of one stupid individual who should have been locked up months before lost me the lot.

So do we stand by and do nothing, or do we try to constrain and control those making the mistakes (Perhaps idiots was too strong), or let them take it all away, because believe me they will.

Hello Mark
I do see your point alright. But most likely the operators used vhf or uhf for their transmission, well I would stay well clear of that even with a 5 watt hand held, they can and do have funny health effects due to the relative deep penetration of the frequencies used. I do not even use a cell phone for this reason. About 10 years ago I did run a study of RF effects for a certain US agency which will remain nameless here. We found that any frequency over 60 to 80 Mhz does indeed have health effects, even a normal cell phone, over time, can boil an egg. Which would be equivalent to frying eye balls. So vhf and uhf do have very undesirable effects. You are quite correct in that, even at very low power levels. Not even to mention cell phone base stations which normally operate at the 50> watt level. But we could find no possible health effect between 9.9 Khz and 40 Mhz. Apart from heating of metal objects at very high power levels.

I agree that the radio works OK in strong RF fields, perhaps we are at crossed purposes.

As to health exposure levels, the development work was carried out in the UK I think in the 70's, the guy that conducted the work is a ham, with an Ft857.

his theories are that below 10MHz doesn't effect the body tissue.

The actual safety levels are all about to be revised, (someone published a new paper) and I believe the lower frequency limits are going to be removed or raised, however a local colleague went temporarily blind from RF and he is a 160m CW operator so well below 10MHz, and we use VLF for heating human tissue for muscle relief and to improve bone growth, so there are effects.

You may be an exception, in a situation where you cannot effect anyone else, and having survived as long in that sort of environment then one would suppose your lucky enough that it won't have any future effects.

BUT, we have a trend of amateur using very powerful kit in very small areas, without any caution to safety, as I said in another post, if the next door neighbour gets effected, or thinks he is effected and knows how to work the press, all hell is liable to break loose for the rest of us. We have set legal levels, if we stick to them, we can blame the authorities that regulate us, not irresponsible operators.

Mark.
I am now 71 years old and in perfect health. Practically all my life I worked in extremely strong RF fields, I am talking about multi megawatt transmitters. The only time I ever had some problems was as I forget to remove my car keys and got a very nasty burn in my pocket as the keys literately went red hot. This was right underneath the antenna system at Northwest cape. So I do not believe any of the so called RF hazards. Sure they might and probably do exist on microwaves which can and do penetrate the human body, but as I worked only on short wave and VLF transmitters nobody bothered about safety measures at least during my working days, apart from removing all metal objects from your body. All this trouble and fear about transmitted RF started only in the last 15 to 20 years. I believe many people have nothing better to do then looking for problems. I do live alone, so nobody else can possible be affected. But this was not the reason of my submission. My submission
was to point out that the FT987D does not seem to be affected by strong RF fields. I also have Icom and Kenwood units here, they are indeed affected and go haywire.

Hello there.
I live in an apartment at ground level, practically no outside room at all. So my antenna starts basically right next to the radio through a home made antenna tuner. If you touch the radio during transmission you burn your fingers on all the HF bands. No possible way to fit a good ground system, there is simply no room.
However the FT897D performs completely flawless in every regard. So I believe that you did do something seriously wrong in your installation. Best 73's

hello mike

well i'm very happy with my 897D i live in an area with 2 cell phone towers within 400m one is from the netherlands and the other one is in germany 200m form here i use a long wire antenna on shortwave and a v-2000 diamond on 2/70 and the radio works normal no problems with flashy swr readings the tuner used on the long wire wich is grounded and connected throuhg a 1:4 un-un is a fc-757at also from yaesu

and after 2 years i am still very pleased with the rig
so there is no problem with big rf here

Some more to the subject. I do use an external antenna for HF transmissions, not internal at all, but due to the lack of a ground system RF goes back to my apartment. No garden at all only a convenient tree. The water system uses plastic pipes, the only ground available is the neutral of the AC line. However I do not use VHF or UHF, even with a properly installed commercial vertical outside antenna there is enough rf floating around to display on the hf bird rf/power meter. So I don't use vhf/uhf at all. I always remember that one of our technicians got killed by a long range airborne radar. The interlocks failed and he worked right inside the beam of the 3cm 500 Kw radar. Well he got literately fried. Maybe its his fault, but that was not a nice experience at all. Hi Jurgen

He was a 160m CW only operator.

His eyes looked to me like he had cataract, the eye specialist said that was not the case and told him to lay off the radio for a month or so.

His eyes recovered totally, but it was quite frightening for a while.

The other guy was normally a 20m / 40m guy with a magnetic loop. Now magnetic loops in themselves have problems, but again low HF freq's.

This was just in my county, in a two year period, I came across these guys by chance, and the eye specialist was well aware and recognised the effects so one assumes might assume there have been more. We try to keep everyone aware now so no one else suffers.

When I suffered bad burns it was low power 27MHz, I was not in direct contact with the RF conductor, but there wasn't much insulation between me and it, and plastic being capacitive is pretty much useless at RF, so like you say that is really a direct RF contact burn.

This surprised me when I found out, my teachings were always not to worry below 10Mz, things like the big 16KHz rugby clock transmitters, you walked around in the room with the valve and RF conductors without a worry. One of my friends managed that project for many years.

Actually frequencies between 1 to 20 KHz can be good for health, they alter the shape of the water molecule and this looks as though there may well be many beneficial health issues.

Cell phones are quite amazing, at 10cm they are just below the safe recommended level, and the authorities seem to think if you put one to you ear, you won't hit any grey matter for 10cm!!!.

Subject: RE: [FT897] Re: My money was refunded.

Hello Mark
I do see your point alright. But most likely the operators used vhf or uhf for their transmission, well I would stay well clear of that even with a 5 watt hand held, they can and do have funny health effects due to the relative deep penetration of the frequencies used. I do not even use a cell phone for this reason. About 10 years ago I did run a study of RF effects for a certain US agency which will remain nameless here. We found that any frequency over 60 to 80 Mhz does indeed have health effects, even a normal cell phone, over time, can boil an egg. Which would be equivalent to frying eye balls. So vhf and uhf do have very undesirable effects. You are quite correct in that, even at very low power levels. Not even to mention cell phone base stations which normally operate at the 50> watt level. But we could find no possible health effect between 9.9 Khz and 40 Mhz. Apart from heating of metal objects at very high power levels.

Mark Vaughan <mark@.... <mailto:mark%40vil.uk.com> com> wrote: Trouble is Roger I see this again and again and again.

Two operatives in my county working from caravans and flats with internal antenna's suffer temporary blindness for several weeks through too much RF.

If you touch the kit and it burns you, you shut it down and investigate, you don't say 'Oh what the hell I live in a small flat so there's nothing I can do'.

Virtually every authority throughout the world that examines and license Ham Radio operators will teach about the safety levels, but it seems too many people choose to ignore this.

You can get RF burns of a 1W CB radio, I know done that as a kid, as a ham radio operator you are licensed to play with power levels that can easily be lethal, and you are supposed to observe the laws for health and safety.

I'm sorry it appeared I was so hard, but we are not getting the message through, if things like this continue, then it won't be long before the person next door suffers directly related health problems and the Gov't takes draconian action and bans the lot, the Gov't and public being even thicker.

I regularly argue with Gov't and Public that don't want a mobile phone mast 100 yards down the road from their school when they all carry mobiles in their pockets emitting 10 times the radiation levels, and they are suceeding. We are presently moving into a fear factor on wireless networks.

I was a proud Top level Pistol shooter in the UK having met the qualifier to go to the Olypmics, the action of one stupid individual who should have been

locked up months before lost me the lot.

So do we stand by and do nothing, or do we try to constrain and control those making the mistakes (Perhaps idiots was too strong), or let them take it all away, because believe me they will.

Have you tried the water pipes.

In many countries the water is quite conductive and supports VLF RF at about 1/10 of it's wavelength in air, you can even capacitively couple to it through a plastic pipe.

It may be totally useless, but then again may just give the characteristic you need, just run a radio earth wire in parallel with the pipe as far as you can.

You are quite correct that very low Rf, if you can call it that, frequencies can actually have a beneficial effect on the general health. We notice that at the about 10khz frequencies gray hair started to get the original color back at the roots, also after a few hours of exposure cases of flue and the common cold started to disappear. We never investigated that part but I do believe an investigation of this side effects should be done. We used actually rather high power levels, I can not go further into this for obvious reasons. One of our engineers actually was hiv positive and apparently the virus just died. He still is positive of course but there are no live virii in his blood. Well that was more then 10 years ago, he is still healthy without any drugs or occurrence of the virus. We did not take any particular notice, but I do believe an investigation should be done. It could be just an instantaneous remission of course the do happen after all. With the 160 and 40/80
meter hams I really dont know what to say. I do believe you of course after all people are different and react differently to any stimuli.

Yes I did try capacitive coupling, it did not work, but the all the water here is rain water and has very few minerals at all. So its an almost perfect insulator, I also used aluminum foil underneath the carpets, I am at ground level here. No go, that way the next houses got TVI, So that was definitely out. So a ground system is almost impossible to arrange, unless I use a jack hammer and break through the concrete into the ground, and then use a nice long ground rod. Anyway I will find something, 73's Jurgen VK6AHI

Only other thing I can think of is to use ¼ wave wires cut for each frequency and throw them out the window, they will form artificial stub earths.

The VLF health issues are to do with the angle of the water molecule, it□s charge, and cell re / hydration which differs between single cell and multiple cellular tissue. Part of my Phd, though my research was not health but other properties and applications. There are only a few individuals in very diverse areas throughout the world looking at this, all making their living from what they have discovered and frightened to release any details for fear of a few multinationals companies and educational fraternities permanently listening on the steal, realistically they need to be relieved of this burden and brought together for proper investigation, I□ve seen some amazing things in this area as it seems have you.

Subject: RE: [FT897] rf fields

Yes I did try capacitive coupling, it did not work, but the all the water here is rain water and has very few minerals at all. So its an almost perfect insulator, I also used aluminum foil underneath the carpets, I am at ground level here. No go, that way the next houses got TVI, So that was definitely out. So a ground system is almost impossible to arrange, unless I use a jack hammer and break through the concrete into the ground, and then use a nice long ground rod. Anyway I will find something, 73's Jurgen VK6AHI

Mark Vaughan <mark@.... <mailto:mark%40vil.uk.com> com> wrote: Have you tried the water pipes.

In many countries the water is quite conductive and supports VLF RF at about 1/10 of it's wavelength in air, you can even capacitively couple to it through a plastic pipe.

It may be totally useless, but then again may just give the characteristic you need, just run a radio earth wire in parallel with the pipe as far as you can.

Subject: [FT897] rf fields

Some more to the subject. I do use an external antenna for HF transmissions, not internal at all, but due to the lack of a ground system RF goes back to my apartment. No garden at all only a convenient tree. The water system uses plastic pipes, the only ground available is the neutral of the AC line. However I do not use VHF or UHF, even with a properly installed commercial vertical outside antenna there is enough rf floating around to display on the hf bird rf/power meter. So I don't use vhf/uhf at all. I always remember that one of our technicians got killed by a long range airborne radar. The interlocks failed and he worked right inside the beam of the 3cm 500 Kw radar. Well he got literately fried. Maybe its his fault, but that was not a nice experience at all. From: K9ZTV
Topic: 19109 Message: 19138

Remembering my apartment days thirty years ago, I would respond to you by replying, "situation normal." The problem is not your 897, but exactly what Yaesu told you it was. Being its an apartment, you probably have little or no RF ground (different from electrical ground), especially if you are living in an upper-story apartment. You need to move that antenna farther away from your rig. The symptoms you relate are classic for RF feedback into the radio.

When I was first married, I used an FT-101B from a basement apartment on 80 & 40 meters by loading up the guttering of a four-story apartment building. Twenty-gauge hookup wire ran out my casement window, through (important to note, not under) half a dozen bushes, to a screw in a downspout. Using a Johnson Matchbox and a heavy braid terminating in an 8' ground rod outside the window and hammered so far down that the rockbed covered it, I was able to pound brass to my heart's content. I made consistent contacts, enough to keep me happy while I was pretending to be a graduate student. I was into everybody's TV and stereos, but they never did ferret out the source, nor did they ever ponder it might be that so-called anachronistic stuff called Morse Code.

Experiment. That's the name of this game. Don't be so quick to blame perfectly good equipment. Especially when you're lucky enough to have TWO of them!

A couple of nights ago I was reading posts that were done in April/May and a ham found that the screws on the boards of 897D became loose with time due to heat expansion and contraction. The solution for him was to tighten the screws. All was back to normal. After 6 months, the same problem again, so he took the screws out and added "c" lock washers. The screws bond the board to the chasis. So loose screws means loss of bonding allowing RF to creep in and cause problems. He said with time, it will begin to affect other bands as well. You may want to review the post. It's worth a try and not very costly. Sounds plauseable to me any way.

Maybe the guy that wrote that post will read this and let us know how it is coming along.

I had a lot of problems operating from my car with the Huslter antenna only a few feet away until I properly grounded the radio to the car chassis. Your problem may have been lack of good grounds (both at the antenna and the radio itself).

19142. CAT Problems with AT-897 & Thanks to G7MNS

Yahoo group: FT897 (2007)
Date: 2007-06-22 19:04:44 UTC
From: ww8zz
Topic: 15378 Message: 19142

After a year of intermittent trouble with CAT control when using my AT-897 tuner, I read Andrew's post about being SURE the mini-DIN connectors are FULLY seated.

In my case, CAT control was impossible via the 'CAT OUT' port on the AT-897. Otherwise, the tuner was fine. Because I could only get a good CAT connection to my computer via the radio's CAT jack, I had to unplug CAT, plug in the tuner, tune, and reconnect CAT at the radio each time. As you can imagine, this became tiresome.

After many diagnostic steps that I won't bore you with, it turns out that the CAT plug was not completely seated in the tuner jack. It was that simple. I just couldn't tell.

So 'hats off to Andrew' and the others on the group. It's good to have that one behind me, and I'm sure there are others out there who have experienced this too... so I wanted to post my recent experience.

Thank you,

Alan WW8ZZ

In general I would agree with Mark on this, not enough consideration is given to RF fields by most amateurs, maybe because most operate at frequencies and power levels that do not present a serious problem. Most times those amateurs who work at microwave frequencies are more cognisant of the problem due to the higher local field strengths involved.

As we have seen in this thread, even relatively low power at
relatively low frequency can create a serious problem.

The UK government (or at least the politicians) often act
emotively. The gun laws that Mark mentions is a prime example of
this. How many gun massacres have happend in US educational
establishments, but the gun lobby still hold sway.

I too have argued regarding the relative power levels of pocket
based mobile phones vs towers at 150m. A tip is to get an
accomplis to ring the objector's mobile whilst they are
arguing....

I can appreciate the tone in which Mark phrased his post, there
are people who seem to disregard the signs of dangerously high RF
fields. But then I used to work in a company that manufactured
megawatt transmitters and took appropriate precautions.

Geoff

I am a condo dweller and also operate mobile and have never had an issue with the FT897D. Sure, the condo in particular, like an apartment, is a difficult situation all the way around, but I don't blame the radio!

Having said that, the need to ground the radio chassis is really not new with any radio, but especially a 100W class rig. That is why virtually all HF radios have the nice ground point on the back! :-)

Proper grounding is just good practice all the way around.

I'm not picking on anybody here and it could be that the original poster did everything right and simply had bad luck with a defective radio. But again, any radio is going to fuction poorly when operated poorly. You need to follow established practices if you expect to get good results.

Make sure you are doing things correctly before you blame the radio!

This problem could have, as has been suggested by other posters, happened to any brand/model of radio. My experience to date, like most of you, is that FT897D is an excellent radio!

19146. Battery Power for 897D

Yahoo group: FT897 (2007)
Date: 2007-06-24 19:12:49 UTC
From: Curtis
Topic: 19146 Message: 19146

This may be a stupid question, but can the 897D use the batteries as a backup. Example is if you have a battery installed and running off a DC power supply, if you loose power to the supply does the radio have the capability to kick in the battery for reduced but continuous power?

Curtis

From: cbautismadvocacy
Topic: 19147 Message: 19147

I just received my Ft-897D. So far I am very impressed by this radio and all its verious functions. But, I am looking for a good portable antenna that will be easily transported on commercial aircraft that will perform well. I have been looking at the Atas-120. Some hams have really been down on it because of its cheap components and price. I am looking for suggestions. I have thought of just making up some dipoles and stringing them up in the tree at a mountain side cabin. So the question is: Save money and make dipoles or purchase a screw driver type of antenna with all bands?

Thanks in advance for you advice.

Yep, but sometimes it won't fire up for a few minutes if it has been
running on a power supply.

I'm not sure why we are continuing on this topic. The original post wasn't to learn how to get it to work, it was to "make Japan aware of this." He never asked for help, nor did he give any information that would let us help him.

On Sat June 23 2007 08:09:13 Mike Kulyk wrote:

The meter to which he is referring may be the internal one. I suspect that they agreed to refund his money instead of trying to teaching him to be a ham.

My suggestion, save your money and cut some wires. If anything, get the AT897 tuner from LDG and carry only one antenna (depending on which frequency you want to use it). In my opinion, the ATAS is good only for mobile (auto) operations. I have not been very successful using it really portable. If you want to turn a campsite into a working station with the 897 then a dipole is the way to go. Again, just my humble opinion.

good luck.

You need to activate the menus and go to the one that has SPOT, BK and KYR on it. Pressing the A key (or the remote mic equivalent) will get you a tone that you can zero beat with the incoming CW signal). There's also a green light that flashes when the signal is spot on. I regularly check into a CW net using a bandwidth of 60hz on receive. The light is sensitive enough that it fails out near the edges of that.

I found that this microphone, standard with Vertex Commercial FM radios, works really well with my FT-897. I have been getting excellent and "clear" audio reports. Only mod I had to do was disconnect a ground strap from the metal mic clip on the back. There are no bells and whistles, but it greatly improves the tx audio quality.

I operate under these conditions most of the time and have not had this problem. I have operated 30m, 20m, 17m, 15m, 10m, 6m, 144, 440 with the antenna in the same small room and had no issues. No issues in my mobile as well. My unit is new from 2007. I did hear that there have been some minor mods that Yaesu has made to the 897 over the years. I did have an older model from 2003 that shut off when I keyed up 17m with the rig in the same room as the antenna.

19162. FT-817-SERVICE MENU/CALIBRATIONS-(also FT-857/FT-897)

Yahoo group: FT897 (2007)
Date: 2007-06-25 15:44:43 UTC
From: kc3vo@aol.com
Topic: 19162 Message: 19162

It is NOT possible to "reset factory values" of the service menu automatically, once corrupted. It is possible/likely that you inadvertently screwed them up, if you ever accessed this menu without FIRST connecting a regulated, external, 13.8 volt power supply, as this voltage level is used as a REFERENCE for the alignment/calibration! (The requirement for 13.8 volts is stated in the YAESU service manual)-A sure-fire indicator of this type menu corruption is the display on the radio showing incorrect VOLTAGE. (Confirm by using an accurate digital voltmeter)-voltage displayed on radio should be within 1/10 volt of what is actually supplied. Re-alignment, using 13.8 volt external power, and proper test equipment as describes in YAESU service manual is the ONLY way to restore proper values and specified performance!-73, KC3VO, Bob Curry

Ignore WB2GLW, he's a troll. He was using his 897 in an extreme situation (antenna very close to the radio) and it couldn't do the impossible so having got rid of it he came here for sympathy and didn't get any so he's hanging around to slag the radio off. Read further down both this group and the FT-857 group and you'll see that 99% of users are very happy with their rigs.

On a more objective note, I recommend the 857 if you intend it primarily for vehicle use and the 897 for anything else. I have both an FT-857D and an FT-897D but wish I'd got two 897s, one with batteries and one with the built in PSU because the form factor and cabling of the 857 is designed for vehicle mounting and not very convenient for desktop use. Even when I take it mobile it just sits on the dash or floor so the 897 with batteries would have been a better choice. In the UK there's only about 10% difference in price now which is well worth it for the extra controls and larger display of the 897.

I am just reporting my experiences. A portable radio like the 897D will not and did not work when it was placed near to a antenna. This means it did not work outside when a MFJ 1622 antenna was near by. IT did not work with the antenna in the same apartment. IT did not work with the MFJ 1622 was outside the window. And this was the same experience my friend had to. The dipole was just outside his apartment. And well the radio did not work.

SO instead of Yaesu offering any repairs of suggestions for a repair. They cop out and just refund the money.

Am I am bad ham,, NO I just tired to get a new radio that is to be portable to work in a apartment.

And it will not. So people thinking about buying it and taking it "portable".. it will not work as you think it will. Or if you are thinking of using it in you home and you don't have the antenna FAR away. Give up on the 897D.

The refund is a way for Yaesu to admit this radio has a problem. SO be advised.

19177. Re: 6 Meter issues

Yahoo group: FT897 (2007)
Date: 2007-06-25 17:34:41 UTC
From: Rob, WB1AEX
Topic: 19079 Message: 19177

Hi Mark,

It is probably too soon to tell if the insertion of the lock washers will restrain the board mounting screws from their loosening tendencies, but I have had no issues at all with run-away oscillation on any bands since the last tightening (roughly 6 weeks ago). The final transistors on my 897D came from the factory with split ring lock washers installed, but those still loosen up as time passes anyway. Someone suggested that using star washers might be a better alternative. When I worked on high power solid state audio amplifiers I recall that it was a common practice to lock down the power deck transistors with star washers. If the self-loosening persists I might give them a try.

My theory is that several of those fastening points on both of the mainboards provide a ground path for various RF stages and other portions of the boards. When the screws back out, that ground path may become intermittent or non-existent, resulting in the run-away oscillation symptom that some have experienced. With some earlier versions of the radio there may be other causes for this symptom, but with my rig, tightening the screws down has made it perfectly stable again.

I think if someone experiences the runaway problem, tightening down the boards and finals should probably be the first step in trying to eliminate it.

Someone mentioned that they thought that incorrect factory bias settings might be a cause for the oscillation problem. As far as I know, the incorrect factory resting current settings have not contributed to the run-away oscillation problem. The tendency I have observed is that the finals will usually be mis-adjusted from the factory very close to cut-off. This will certainly result in a very gritty and distorted sounding radio, but should not cause the run-away problem.

73,

Rob WB1AEX

First, I am sorry that I could not assist you BEFORE your radio was returned, as I could likely have helped you resolve your problems! One thing we must ALL realize, is manufacturers and dealers are becoming VERY reluctant to get too involved in assisting in educating operators in HOW to operate a radio transmitter in the circumstances mentioned, due to possible LEGAL issues related to RF exposure and other problems, so they may feel that refunding money, and taking back the equipment is the best route to take! I will say that in many cases it IS possible to successfully operate the radio mentioned, in other than recommended RF environments, by somewhat modifying the installation, and adding ferrite beads and counterpoise/grounds. Yes, the radio should IDEALLY be used with an outdoor, coax fed, resonant, and properly matched antenna system that is over 50 feet away from the radio, house, or other objects, but in reality, many of us operate in conditions far from this ideal. If we have the knowledge/luck to get it to operate ON OUR OWN, and operate contrary to best procedure, it is NOT the dealer/ manufacturers fault, so they are not liable, as might be the case if they TOLD us how to operate in adverse conditions! This applies to ALL radios, not just YAESU!---73, KC3VO, Bob Curry

At the risk of continuing this thread even further, have you found ANY radio that will operate in the conditions you describe Mike?

73,
Ken

Subject: Re: [FT897] Thinking about Buying 897

I am just reporting my experiences. A portable radio like the 897D will not and did not work when it was placed near to a antenna. This means it did not work outside when a MFJ 1622 antenna was near by. IT did not work with the antenna in the same apartment. IT did not work with the MFJ 1622 was outside the window. And this was the same experience my friend had to. The dipole was just outside his apartment. And well the radio did not work.

SO instead of Yaesu offering any repairs of suggestions for a repair. They cop out and just refund the money.

Am I am bad ham,, NO I just tired to get a new radio that is to be portable to work in a apartment.

And it will not. So people thinking about buying it and taking it "portable".. it will not work as you think it will. Or if you are thinking of using it in you home and you don't have the antenna FAR away. Give up on the 897D.

The refund is a way for Yaesu to admit this radio has a problem. SO be advised.

Hi Nick,

I use Cat interface from G4ZLP, he also sells the adapters for just this purpose, Mine is the Digimaster - combined soundcard interface and CAT. There is also a CAT only Multiface available. The lead for the 897 Mic socket is the Y4.

Have a look at http://www.g4zlp.co.uk

Hope this helps

So then Yaesu should advise that the antenna needs to be 50 ft away. And ANY ANY antenna lest than 50 ft. Even if the antenna HAS A perfect match. Under 1.5/1 then the radio still will not work. And the portable nature of this radio is only for show.

First, I am sorry that I could not assist you BEFORE your radio was returned, as I could likely have helped you resolve your problems! One thing we must ALL realize, is manufacturers and dealers are becoming VERY reluctant to get too involved in assisting in educating operators in HOW to operate a radio transmitter in the circumstances mentioned, due to possible LEGAL issues related to RF exposure and other problems, so they may feel that refunding money, and taking back the equipment is the best route to take! I will say that in many cases it IS possible to successfully operate the radio mentioned, in other than recommended RF environments, by somewhat modifying the installation, and adding ferrite beads and counterpoise/grounds. Yes, the radio should IDEALLY be used with an outdoor, coax fed, resonant, and properly matched antenna system that is over 50 feet away from the radio, house, or other objects, but in reality, many of us operate in conditions far from this ideal. If we have the knowledge/luck to get it to operate ON OUR OWN, and operate contrary to best procedure, it is NOT the dealer/ manufacturers fault, so they are not liable, as might be the case if they TOLD us how to operate in adverse conditions! This applies to ALL radios, not just YAESU!---73, KC3VO, Bob Curry

Hello All !!! First , I am building an amplifier interface and am curious if anyone has experiences using the CAT / Linear port ?? I have my rig of course switched over to the 'Linear' configuration . My question is - does pin TX INH (that is transmitt inhibit) need to be grounded or does it need to see a + voltage to keep the xmitter from operating ??? Now onto the comment concerning the current thread about apartment usage of the ft897 - I would be betting that the moderator probably will stop the nonsense that one individual may be causing soon.... (why would anyone complain about getting their money back ??) 73s and Keep enjoying your FT897s - Ron KA0RYT

I don't know how much close an antenna can get, but I can use my 897 with a right-angle adapter and a rubber duck on it at 5w with a TNC on the top and not run into any problems with mobile packet.

From: kc3vo@aol.com
Topic: 19187 Message: 19187

The 50 foot distance between radio and antenna was MY statement, NOT YAESU.
I have found that most radios WILL perform well at 100 watts or less, with
good antennas 50 feet or more away.--This does NOT mean, that in some cases,
an antenna CLOSER than 50 feet is unusable, but is to indicate that the
satisfactory use of a closer antenna MAY entail more difficulties, and require more
skill in preventing unsafe RF exposure, RF feedback, TVI, and other RF
related abnormalities. Personally, I have operated MY FT-897 at full power with
antennas only 10 feet away, so I know that it IS possible(perhaps not
ADVISABLE) to do so, IF the antenna is good, and properly matched.-KC3VO

Look in the files section of this group:

MD-1 Desk Mic to FT-897 Adaptor.txt

I wrote up a detailed pinout & description of how to put this
together using only a short section of CAT-5 ethernet cable
(one end, about 10") plus an 8-pin round mic connector.

I got a really nice MD-1C8 that my club was selling, and I'd
wanted a desktop mic, so a little thing like mismatched pins
and plugs wasn't going to bother me.

You'll have to solder it (or get a friend). I don't think this
is sold anywhere. It's an easy project though, even if you don't
wield a soldering iron often.

It did help a lot thanks. However, I was surprised to learn you can't program the memories by the mic cat, only the rear cat! How odd. I suppose I could take the tuner out of circuit and get the radio fully programmed and then use the front for control.

I also like the look of the data/cat interface. I have used neither data nor cat on this radio so I'm looking forward to having a play...

tnx,

Nick

I'm unfamiliar with the IC-718, but your buying decision vs
the FT-857 and FT-897 is easy - they're almost the exact same
rig. I believe (other may have discussed here) the circuit boards
are even the same.

However - if you're going 'mobile', i.e. mounted in a car/truck,
RV, the FT-857D is your choice. If you *might* occasionally go
mobile (like camping, or emergency use), and *might* want the
flexibility of using built-in batteries, or a built-in AC
supply or a bolted on antenna tuner, the FT-897 is the choice.

As for other comparisons, this group would be a bad place to
do research - about 99.9% love either or both rigs, so objectivity
might not be good here.

The Icom-718 was also on my list, but it didn't go to 6m,
(AND 2m and 70cm) and wasn't portable (even though mine is
desktop-based). Any add-ons would be external to the rig and
separate. I think it has mostly identical features to the
897/857, and CERTAINLY the PRICE is better.

I was looking for less desktop clutter - if I'd bought the 718,
I'd want to keep a separate 2m/70cm mobile (plus power, plus
mic, etc...). The FT-897/857 - it's all in there.

73 and good luck on your choice.

Mike:
Give it up.
There are a number of us that operate our radios in close proximity to the antenna and have no trouble. If there's a problem then in most cases it's just a matter of a few clamp-on chokes at the radio and it's fine. In looking back in your messages I don't see that you actually tried anything like that to fix the problem.
While there are some radios that work fine with lots of RF floating around on them, particuarly the mil style man-pack radios, a good number of Ham radios from various manufacturers simply don't have adequate decoupling at the mic, power, and various other connection for this kind of situation. So, it's not an unexpected situation, it's easily avoidable, and the FT-897 isn't really unusual in this respect.
Like my dad always said... "It isn't that the food is bad, it's that it tastes bad to you." Likewise, it isn't that the 897 is a bad radio, it's just that it didn't work for you. So just say it didn't work for you and move on.

Same here as well, running 5w VHF into a 1/4 wavelength whip. Of course, running it at full power in this configuration is dangerous.

Oh, and I _DO_ run the FT-897D at full power with a dipole in the attic; the closest point of the dipole to the radio is about 15 feet. The station IS grounded to a water pipe, though. Before I had a good ground, the radio worked fine, but an LDG Z-100 tuner (plastic shell) didn't work well. I now use an LDG Z-11 Pro tuner (metal shell).

Sadly, while good grounding is emphasized in amateur books, the SYMPTOMS of poor grounding are NOT emphasized, so many amateurs (including me at one time) don't recognize the symptoms. Note that RF can get into the radio through the microphone; see http://www.ae7q.net/doc/public/MH-59.html

If WB2GLW thinks this is Yaesu's fault, he should try the Icom IC-7000. The Icom IC-7000 WILL SHUT DOWN if you have a 1/4 wavelength whip for an antenna, REGARDLESS of the power setting. I'll bet there are a LOT of radios out there that have problems with inadequate grounding. Note that the Yaesu FT-897D manual devotes a whole page to grounding, PLUS part of an additional page to RF exposure:

"Although there is negligible radio frequency (RF) leakage from the FT-897D transceiver itself, its antenna system should be located as far away from humans and animals as practicable, so as to avoid the possibility of shock due to accidental contact with the antenna or excessive long-term exposure to RF energy."

However, no manufacturer is able to modify the laws of physics.

I have run the FT-897D with 100 watts just fine in portable operations (see http://www.ae7q.net/doc/public/ATAS-120.html). Note that:

1. The antenna was 100 ft away.
2. I did have problems in that configuration (but not at home w/ a good ground) with RF getting into the MH-59 microphone; that required RF suppression in the microphone: http://www.ae7q.net/doc/public/MH-59.html

You haven't told us (or I missed it):

1. What microphone you were using.
2. What provisions you made for grounding.

Mike:
You need to read my posting before responding to it.
Did you take measures to block the RF from getting into the radio and accessories or did you assume that this was Yaesu's responsibility dispite the amount of stray RF? Were you and your friend dealing with the problem the same way?
You and your friend didn't get crappy radios, you just didn't sort out the problem you were having and solve it.

Darnit I was just getting ready to see what a red hot glow stick and melting rubber would be like. I feel my eyeballs getting warm!

I must be one of the few left in the ham community that runs bare minimum RF output in order to maintain communications.

Of course I've always enjoyed QRP having been in an apartment for many years yearning to fire up the rig to full power. Now that I just purchased my first house, heck...I don't even have antennas up yet and I still operate QRP. What kinda ham am I? :P

Thanks for the laugh Dean!!! Next month marks my 20th year as a ham.

> switched over to the 'Linear' configuration . My
> question is - does pin TX INH (that is transmitt
> inhibit) need to be grounded or does it need to see a
> + voltage to keep the xmitter from operating ???

According to the schematic, TX-INH, via R1560 (1K),
and R1208 (47K), drives the basis of transistor Q1045
(NPN, emittor to GND). When Q1045 is conducting,
it will rob the transmitter logic from power and
hence disables it.

So, a small voltage on TX-INH should block the transmitter.

You can try yourself by putting a resistor in series -
10K or so should be safe. But, as always, verify
comments like this from a stranger.
I did get schematics with the rig. I hope you have them too,
so you can verify (Q1045 is about 3 inches above the
main CPU on the MAIN-UNIT drawing).

Ron,

I received my FT-897D on Friday last week. So far I am very pleased. The rig is fairly simple to operate and navigate the menus, and it is very versatile. I can go qrp 5 watts on battery or 100 watts with the attached power supply (FP-30). I also added the LDG AT-897 that works excellent. So far I have not had any problems with the rig that others have posted. I am using a 40mtr Vee up about 20 feet and near my window.

If you are looking for versatility, I don't know if there is another rig out there that can match it for the price. Also, I really like the CW features. I installed the W2RF.Com 500HZ Collins Mechanical filter.

The rig is small enough that I am going to outfit a back pack for it so that I can do some QRP ops in the mountains in Washington State in a few weeks.

Hope that helps!

In my opinion, having had the 2.3kHz, 2.0kHz (from InRad), and 300Hz filters, you want the latter two. Remember that you can always use the DSP filter to do wider filtering, and then use the mechanical filters in extreme conditions, when you need the sharper skirts.

19213. Buying An 897

Yahoo group: FT897 (2007)
Date: 2007-06-25 23:50:22 UTC
From: Freddy T. Bratton
Topic: 19213 Message: 19213

It looks like it is getting a little heated.

I have no dog in this race but I feel I must comment.

I have the first 897 that came to Memphis,TN. I have had zero problems with it. Not the slightest complaint in that respect.

However, my opinion is that it is a very mediocre radio in reciever preformance and other performance issues. The only redeeming quality is that it is by-far the most versatile portable radio in the market. It has batteries, slip-in ac power available. You can transmit at 20 watts hf if memory serves. You can even get a factory tuner that is far more mediocre than the radio itself. If your needs are various portable uses, that's the one to get. The FT-100 is a much better choice for mobile over the 897's counterpart.

I hope the FT-450 pans out and it a good radio. I might look at that one as well.

My 897 sits on the desk next to the FT-100, FT-900 and Kenwood TS-850AT. It's quality is fine, it's rugged and if you want to take the trade off of mediocrity for the portability,it's a winner for sure. By no means it is bad, just a jack of all trades and master of none. But try dragging a full sized radio out to the woods, field day ect. It definitely has a place but is that place in your shack????????? You have to decide that.

Well said Freddy

I agree with your feelings entirely. I have previously
added "technical topics" to this group which back up your comments.
I must say when I first started using the FT897 I was disappointed.
With some slight modifications (Rx audio), easy additions (IF
filters to suit my operating conditions & RF speech processor) and
adjustments (TX Bias adjustments) I now have a nice little rig
especially for the price..

As far as the discussion re EMR issues the only result has been
dissagreement. Contributors all have there own opions. I also don't
want to way in on this. May I suggest to those that want to voice
their opions that you start a NEW DISCUSSION GROUP so the rest of us
can have some meaningful FT897 talk! ANY ONE ELSE AGREE?

19216. EMR ISSUES

Yahoo group: FT897 (2007)
Date: 2007-06-26 00:24:39 UTC
From: David
Topic: 19216 Message: 19216

Topics at tne present time seem to becoming EMR issues and the only result has been dissagreement. Contributors all have there own opions. I don't want to way in on this. I have attended expert lectures on this subject and even the experts cannot agree. The AUS/NZ standards havn't been agreed upon! May I suggest to those that want to voice their opions that you start a NEW DISCUSSION GROUP or KEEP IT UNDER THIS HEADING so the rest of us can have some meaningful FT897 talk! ANY ONE ELSE AGREE?

David

The levels are well set throughout the world, yes there are arguments but these have only minor effects on the safety level.

This is an issue that effects every ham, no matter what radio he has, moving to another site is a possible idea, but those that might join that sight already know the safety levels.

The reel concern has to be over the idiots that don't give a damn, their irresponsible attitude will get the public to tar us all with the same brush and ban our hobby. We are not far away from this becoming real, and once someone kicks the ball off to ban our hobby we won't stop it. If we want to keep our hobby, we must address these issues to advise those operating in unsafe conditions before it s taken out of our hands.

Most the safety levels are pretty similar, if you work with one, or close to one you have a good safety margin, but sitting a foot away from a 100W antenna you are way way way above any safe level.

Hello Bob.
I could not resist to congratulate you for this submission. You are very correct indeed that legal issues are involved. But as I pointed out a couple of day's ago, a few RF suppressors sleeved over all incoming and outgoing lines to and from the radio will solve the problems encountered even in an extremely strong RF field.. So I suggest we end this issue once and for all, it just becomes boring now.
Jurgen VH6AHI

Mike Kulyk <mkulyk@...> wrote: So then Yaesu should advise that the antenna needs to be 50 ft away. And ANY ANY antenna lest than 50 ft. Even if the antenna HAS A perfect match. Under 1.5/1 then the radio still will not work. And the portable nature of this radio is only for show.

First, I am sorry that I could not assist you BEFORE your radio was returned, as I could likely have helped you resolve your problems! One thing we must ALL realize, is manufacturers and dealers are becoming VERY reluctant to get too involved in assisting in educating operators in HOW to operate a radio transmitter in the circumstances mentioned, due to possible LEGAL issues related to RF exposure and other problems, so they may feel that refunding money, and taking back the equipment is the best route to take! I will say that in many cases it IS possible to successfully operate the radio mentioned, in other than recommended RF environments, by somewhat modifying the installation, and adding ferrite beads and counterpoise/grounds. Yes, the radio should IDEALLY be used with an outdoor, coax fed, resonant, and properly matched antenna system that is over 50 feet away from the radio, house, or other objects, but in reality, many of us operate in conditions far from this ideal. If we have the knowledge/luck to get it to operate ON OUR OWN, and operate contrary to best procedure, it is NOT the dealer/ manufacturers fault, so they are not liable, as might be the case if they TOLD us how to operate in adverse conditions! This applies to ALL radios, not just YAESU!---73, KC3VO, Bob Curry

Look in the files section of this group:

MD-1 Desk Mic to FT-897 Adaptor.txt

I wrote up a detailed pinout & description of how to put this
together using only a short section of CAT-5 ethernet cable
(one end, about 10") plus an 8-pin round mic connector.

I got a really nice MD-1C8 that my club was selling, and I'd
wanted a desktop mic, so a little thing like mismatched pins
and plugs wasn't going to bother me.

You'll have to solder it (or get a friend). I don't think this
is sold anywhere. It's an easy project though, even if you don't
wield a soldering iron often.

I have to check the files section more often. I purchased two inline 8-pin male jacks last year in order to make an adapter for an existing 8-pin microphone. Never got around to doing the pin mapping so the jacks have languished in a storage tray. This document is exactly what I need. Time to get the RJ45 crimpers and CAT5 cable out.

Tnx and 73!

I have both the FT-857D and the FT-897. I love them both. I picked up the FT-897 on field day and the LDG Z11 Pro Antenna Tuner hooked up to a 102" wipe on a 20' pole and made connects all over the US on 3MHz and up. I picked up the batteries for the FT-897 as well. The batteries charged up and we use them Saturday night. The club like the FT-857, it was easy to use.

I have the ATAS-120 hooked up to my FT-857D in my truck and its works well. I think the the Z11Pro and the 102" wide works betters. Now I'm not a general so 10M and up for me. My friend has the same setup in his Toyota and he loves it as well. Oh my Friend loved the FT-857D he bought both the FT-817 and the FT-897. He as all three of them.

If you like Icom test drive one first. Drive by a hill top with repeaters on it and see how open the front end is on a Icom.. Our field day was 2 miles from Mt Wilson in Poway, Ca and the Icom 706 got beat up by the repeaters.

According to the manual:

Multi Function Row "i" "... allows selection of the display function of the meter in the transmit mode
PWR => ALC => SWR => MOD => PWR"

Menu Item 061 "Selects the meter display configuration while the transceiver is transmitting"

Sounds like the same thing to me, but the Menu Item 61 setting doesn't appear to affect the meter.

What am I missing?

Subject: [FT897] A good versitle antenna that can be used portable

I just received my Ft-897D. So far I am very impressed by this radio
and all its verious functions. But, I am looking for a good portable
antenna that will be easily transported on commercial aircraft that
will perform well. I have been looking at the Atas-120. Some hams
have really been down on it because of its cheap components and price.
I am looking for suggestions. I have thought of just making up some
dipoles and stringing them up in the tree at a mountain side cabin.
So the question is: Save money and make dipoles or purchase a screw
driver type of antenna with all bands?

Thanks in advance for you advice.

Thank you David... I found on Ebay (search dipole mount) a mount which uses two mobile resonators that can be used to have a vertical dipole or horizontal dipole. The mount has a clamp that can be used to attach to a pole such as a 25 foot telescopic pool pole or other configuration that ones imagination can dream up. Very similar to the buddipole, but a lot less expensive. Let me know what you think.

Hi,
It is possible to do this, but you will have to make a jumper box.
My Turner +2 was wired for four pin din and the 897's use a modular plug. There are only three pins thata are really used if you want to hook the Turner to the 897. They are Mic (audio), PTT (trans), and Ground.
I built a small box with a four pin male din like comes out of the radio. I then used some cat five cable, but only used three strands and connected them to the din in the box according to the four pin I had, mine was Cobra mic scheme. Next I was able to connect the modular plug for the 897 to these three wires with a spare plug and the crimping tool for 8 pin modular plugs.
If looking Over the top with the plug pointing away from you this is the pattern. ou want to connect the wires using slots 5,6,7 respectfully only. Pin 5 is for the MIC wire, pin 6 is for the PTT wire, and pin 7 is for the GROUND wire. Use only these three wires and the Turner mic will work. You may look on page 12 of the manual for the pattern of the modular plug if you like.
This mic will really wake the 897 up. To start cut mic gain on 897 to setting 5 and run the Turner about half way.
I'm sure you will get good results, these are great mics.
Without knowing the wiring on you radio I cannot be over specific, but I am sure you see the idea.
Hope this works for you.

From: Tim Lyons
Topic: 19223 Message: 19231

I used to use one of those Turner microphones back in the CB radio days. I do have a D-104 hooked up to the 897. It is configured with a Heil HC-5. It sounds pretty good so I am told. I have a cat 5 cable hooked to it from the mic base.

Good luck with the setup. I think that Turner microphone is great looking. All you need to do is get one of those LDG meters and disassemble it, paint the box silver and set it next to the Turner and you get that "retro" look for the desk top.

19232. Re: Yaesu MD-1B with FT-897D

Yahoo group: FT897 (2007)
Date: 2007-06-28 15:30:34 UTC
From: Michael Yancey
Topic: 19156 Message: 19232

Very cool. Yes, the MD-1 is my current mic right now.

If you snag a short CAT5 patch cable for free or cheap (I found
a black one to match the typical mic cable color!), you won't
even need to crimp. CAT5 has 8-pins and fits fine and I used
about 8 or 10 inches. Doesn't seem to have any RF problems, but
I'd like to know if anyone else does.

I typically do that - it's the 'lazy-man's way out'.
In fact, our club has recently put up a 900mhz repeater, and
I've put together an article for our newsletter on how to build
the typical RS-232 level-converter cable for a Kenwood TK-941.
This one uses a 6-pin modular, which is easily handled with
MJ-12 phone wire.

I can solder an 6- or 8-pin round, but I can't solder to
6-pin mini-dins (!) so I do the same thing - fetch a PS/2
mini-din extension cable - cut off one end and you have the
better part of a FT-897 Data Cable.

I like modifying commercial cables rather than crimping -
it just assures a good connection and it's about a $2 or
$3 solution.

19233. OP Codes to program memory

Yahoo group: FT897 (2007)
Date: 2007-06-28 11:17:22 UTC
From: Tom Cardinal
Topic: 19233 Message: 19233

I am a ham and a computer programmer and I am trying to find the information needed to read and store data in the radio's memory. I've looked at other programs and they don't have some of the features I'd put in them. I've Googled the information and it appears to be non-existant on the net. The programs I've looked at are all closed-source/commercial. I intend to write and release something in open-source/GPL so others have the ability to modify/change things to their hearts content.

19235. Interfacing the FT-897D to an Amplifier

Yahoo group: FT897 (2007)
Date: 2007-06-28 16:36:34 UTC
From: JIMMY D HARRIS
Topic: 19235 Message: 19235

Hi,

I'm new to this email group so I'm not sure if this question has been asked before. I've looked thru the email archive and have not found direct reference to this.

I would like to use my new FT-897D with my AL-811 amplifier. I realize the CAT/Linear/Tun DIN plug and the ACC jack in the back can be used. Does anyone know of a source of cable(s) or have a schematic to make a cable? Is there a way to use the DIN plug for CAT and amplifier at the same time? Or, is there a way different way to interface a computer and amplifier at the same time. I have a Heil footswitch with two outputs that are sequenced. Could it be used to key the amp rather than the radio. Of course, it would not work with digital modes from a computer.

Thanks for the help and 73.

It is my understanding that the codes are to either dump or load the
memory in bulk. they are unable to go item by item or memory by memory.
It's not published by Yaesu but the codes were probably snarfed by
watching two radios clone. I would think that it's the same code for all
the yaesu radios of this line but the structure of data returned is
quite different depending on model.

Someone also stated to me a few years ago that the instructions and data
structure were available to someone who asked.

Let me know if you pursue this and I may be able to give you a hand.
Specially if it's in Java across all platforms.

There is a brightness pot on the back recessed into the back of the meter. You can adjust the intensity with that pot. Maybe it isn't maxed out yet.
I like that little meter. I've gotten quite used to using it.

I just checked my display intensity on the 897. It is set to 3, the highest level. The FT meter is not maxed out and it still seems about as bright as the 897 display. I am using the meter with the blue back light. I do know that there is an earlier version that used a regular light. You might want to contact LDG. They have a tech support phone number in the manual. It is (410) 586-8475. Give them a call. They've also got an e-mail for tech support (again in the book on page 11).

I am using the meter with the blue back light. I do know that there is an earlier version that used a regular light. You might want to contact LDG. They have a tech support phone number in the manual. It is (410) 586-8475. Give them a call. They've also got an e-mail for tech support (again in the book on page 11).

19247. I have had my FT-897 for 3 years now

Yahoo group: FT897 (2007)
Date: 2007-06-30 18:57:08 UTC
From: Ask me.....
Topic: 19247 Message: 19247

I bought my '897 about this time of year three years ago. I have used it in the field camping on several occasions. I have used it in my apartment with a random wire with a counterpoise on the tuner. Never have I been burned with RF. When camping I used a tripod with a 3/8 x 24 mount and run Hamsticks for antennas. There are 8 radials around 17 feet long under the mount. This may not be the most effective of antennas to use, but when packing light for camping it works well enough. I am totally satisfied with my 897. I agree with many of the posters that proper operation of the equipment will give good results and fun.

73,

Pat WB7FFI

Hi Jim,
I did a search on eBay and found a cable, won the auction, and have been using it. I think it cost between ten and fifteen dollars. It goes from the ACC connector to the relay connector (RCA phono) on my ICOM IC-2KL, and it has been working well. No need for an ALC connection--just watch your output from the 897D. I get about 400 Watts out for about 30 Watts in.

I hope this helps. Good luck!
73, Rob KD7H

Hi again!

I just realized I made a mistake with my first reply to you. My connector goes from FT-897D CAT/LINEAR connector to the Relay connection on my amp. I do not use the ACC connection on the FT-897D. I confused the FT-897D with my TS-850 which does use the ACC connector for the amp.

Cheers, Rob KD7H

19250. Homebrew cable for MT-63 transmission?

Yahoo group: FT897 (2007)
Date: 2007-07-01 01:06:04 UTC
From: von_landstuhl
Topic: 19250 Message: 19250

I'm using an FT-897D for MARS. I'm able to receive MT-63 using the IZ8BLY application and connecting the radio's headphone jack to my laptop's Mic In.

I'm looking for an inexpensive solution for transmitting. Does anyone have any homebrew schematics?

Thanks,
Joe

Hey Jim, they are also avalible from MFJ. I bought 1 fro HRO a while back. Theirs is made to connect to the Ameritron ARB-704 buffer. You can whack that end off and attach a RCA plug if you like. If you use it with the 704 buffer, the radio supplies the 12 v to the buffer so you don't have to power it ext.

Subject: [FT897] No power output on VHF/UHF

Hello All,

FT-897,
no RF power output on VHF/UHF, any mode. With external watt meter
inline, I see about 0.5W forward. This does not change no matter what
the RF power setting is set to in the menu.
When push the PTT, TX light is red, but no RF power output.
HF is working fine.
I have tried the HOME + power on as to reset the processor.
I know the antenna is fine, tested it with other radio.
What could be gone wrong, what compondent is likely to fail on the PA-
Unit.

Thank-you in advance

I agree. In my 30 plus years of operating, RF can do strange things. In can get into everything, including you HI! But the best thing is use good common (electrical) sense. Grounding and shielding are very important.

I have an FT-897D that is supposed to be delivered today via UPS from HRO.. We will see how it goes. This is my first post with this group.

19254. RE: [FT897] Re: Gap Antenna - Titan DX

Yahoo group: FT897 (2007)
Date: 2007-06-29 13:05:18 UTC
From: KJ7UN
Topic: 19236 Message: 19254

Hello, Doug =

I have a Gap TitanDX and I really love it. I've worked around the world with it and, much to the dismay of my friends with big beams, I often work DX that they think I should not be able to work!! I've worked Antarctica on 5 watts with it and have ZERO complaints. Although I have a lot of ground space, my OM isn't "fond" of antennas (yet, I'm working on him) so going with a vertical was a compromise, initially. I first had a Gap Eagle, which did very well for me - but I eventually upgraded to the TitanDX, to get a couple extra bands. The performance has been better than I ever imagined here!

I have high winds in spring here and my Titan (and the Eagle) both sustained them well with a minimum of maintenance. I did fail to see that my Titan had slipped from its mounts this spring and blew up my Mark V with some high SWR during winds - but my radio was fixed and the antenna put back into position. It was my fault for not examining it more carefully during our windy season. When I took it down this spring, I replaced all the jumper wires and did lots of testing and tweaking to get everything just right. I have really terrific SWR readings on all bands now. The antenna is low maintenance and easy to work with. PLUS, the guys at GAP are really wonderful, if you need tech support or advice.

Hope some of that helps! Feel free to email me if you have more questions.

19255. What am I doing wrong--Internal batteries

Yahoo group: FT897 (2007)
Date: 2007-06-29 22:17:46 UTC
From: jsteinberg48
Topic: 19255 Message: 19255

I have reviewed the manual several times and search for an answer but can't find anything.

The internal Yaesu batteries charge but when I try to turn on the radio, nothing. I see the red
LED indicating charging.

With DC power from my power supply supplying the radio i get a green light on the lower LED and an orange light on the upper LED.

There appears to be no software / internal setting to "tell" the radio it has batteries; For the
life of me, the only reason I could figure out that it doesn't turn on is the internal batteries
are bad.

Before I return them, any suggestions?

Subject: Re: [FT897] Old Turner Microphones

I used to use one of those Turner microphones back in the CB radio days. I do have a D-104 hooked up to the 897. It is configured with a Heil HC-5. It sounds pretty good so I am told. I have a cat 5 cable hooked to it from the mic base.

Good luck with the setup. I think that Turner microphone is great looking. All you need to do is get one of those LDG meters and disassemble it, paint the box silver and set it next to the Turner and you get that "retro" look for the desk top.

19258. Quick question about current draw on FT-897D

Yahoo group: FT897 (2007)
Date: 2007-06-30 01:17:17 UTC
From: sholtofish
Topic: 19258 Message: 19258

Hi,

I am thinking about buying an 897 and plan to operate it on my existing 10 amp supply. I realize this isn't going to give me full power out but as I mainly do cw & digital at no more than 10-30W I am hoping the psu will be adequate and I can save some pennies.

I was wondering if anyone could do a quick test for me? - transmit a solid carrier at 10W, 20W & 30W and measure what the current draw is from a 13.8v DC supply at each power output?

From: K.Greenough
Topic: 19259 Message: 19259

Hello all,
Sorry if this has been asked before, but I can't see any reference in back mailings.
Has anyone changed the Driver FET's on the main board of the 897?
If so, how? The same circuit is used as the output on the FT817 and it's a seperate small PCB but in the 897 [and 857] it seems to be integral with the main board. Surely you don't have to replace the board?
I am considering cutting the PCB around the dual FET / heatsink assembly and grafting a new driver unit in place, but is there an easier way?
Thanks for any suggestions.

19260. Bandwidth for PSK31

Yahoo group: FT897 (2007)
Date: 2007-06-29 15:21:37 UTC
From: William A Lathan
Topic: 19260 Message: 19260

I've had the 897D for only a few weeks, and I just got it on PSK31 using MixW (I'm using the US Interface Navigator)as the interface to the radio). When I set the frequency of the 897 to 14.070, only about 3KHz shows up in the waterfall display. I've enabled DSP and set the low cut and high cut values so that I should now have a BW of about 6KHz. Unfortunately, that still doesn't work as I only see the 3KHz BW. Does anyone have any ideas what is limiting the BW?

TIA,

Bill, AK5K

Joe, If you go to my site I have posted schematics that may help you.
I build / sell this interface but also have a copy of the schematic any ham can download if they want to home brew one.
You should be able to just build the Audio out and PTT sections. Leave out the CAT converter.

19262. Re: [FT897] Bandwidth for PSK31

Yahoo group: FT897 (2007)
Date: 2007-07-01 05:13:04 UTC
From: Lee Jorgensen
Topic: 19260 Message: 19262

Bill,

PSK is limited to a sideband, which is about 2.5-3khz. The software is limiting where you can transmit, not the radio.
You could always turn the dial up and down a bit to move on the band, and it shouldn't affect your reception of others. Typically, it's 14070.15 ... but if you're at 14070, we'd still be able to talk, just your offset inside the waterfall will be different than what I would be displaying.

You may want to actually turn off all DSP on the signal, since some of the faint (but workable) signals may be blocked. The software is where the signal processing is, not the radio.

BTW, you may want to look at Ham Radio Deluxe for PSK31. It's intimidating at first, however, once I started actively playing with it, it's much nicer than some of the other packages out there. Plus it has a built in logging package, which really makes things a snap to save.

What you describe is normal, and a BW of 3 Khz is about right.

Remember that your center frequency is 1000hz. When you work a PSK signal, be sure that it is centered at 1000hz. That way you can use whatever narrow filters, i.e. 300hz, 500hz that you have installed on your 897. Narrow filters make all the difference on PSK.

Check out DM780. It is free for download and works fabulously with the FT897.

After charging the batteries, for some reason I have found that I need to turn my external power supply off for several minutes before the FT897 will power up with the batteries alone. Turn off the external power supply, then try waiting 30 minutes and then power up with the batteries.

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

19266. Re: [FT897] What am I doing wrong--Internal batteries

Yahoo group: FT897 (2007)
Date: 2007-07-01 12:31:30 UTC
From: robert donchez
Topic: 19255 Message: 19266

on my 897d, with batteries installed and the rig connected to an external supply through the connector on back of rig and power supply turned off, my 897 will not operate on batteries until i disconnect the plug to the 897. i have never left the power supply off for more than a minute or 2 connected to rig to see if batteries would take over- but i found that if i pull out the plug to 897 from the power supply, batteries will then work. it seems like the 897 can still read some type of measurement (resistance) when the power supply is off but supplying no current. i am not technical enough to figure it all out- but i know if i shut off the p supply and pull out plug to 897- batteries work instantly

19267. Re: No power output on VHF/UHF

Yahoo group: FT897 (2007)
Date: 2007-07-01 04:55:52 UTC
From: adthomas11
Topic: 19084 Message: 19267

I just had same problem. No output and what sounded like intermittent
IMD on VHF and UHF.
Yaesu replaced the PA board and some components. Did not say what
cause was.
This was all under warrantee.
Took about two weeks overall.

19268. Re: [FT897] Re: Gap Antenna - Titan DX

Thank you very much for the review. I picked mine up from HRO yesterday and have it in the garage checking it out. Getting ready to move it outside to start assembly. Been reading the instructions and does not look to bad for install. I plan on having my sons come over when its time to put up. Don't think I want to try that myself as its going on top of a 12 foot pole attached to the patio cover. Will keep you posted as to the progress.

Thanks

Doug

Subject: RE: [FT897] Re: Gap Antenna - Titan DX

Hello, Doug =

I have a Gap TitanDX and I really love it. I've worked around the world with it and, much to the dismay of my friends with big beams, I often work DX that they think I should not be able to work!! I've worked Antarctica on 5 watts with it and have ZERO complaints. Although I have a lot of ground space, my OM isn't "fond" of antennas (yet, I'm working on him) so going with a vertical was a compromise, initially. I first had a Gap Eagle, which did very well for me - but I eventually upgraded to the TitanDX, to get a couple extra bands. The performance has been better than I ever imagined here!

I have high winds in spring here and my Titan (and the Eagle) both sustained them well with a minimum of maintenance. I did fail to see that my Titan had slipped from its mounts this spring and blew up my Mark V with some high SWR during winds - but my radio was fixed and the antenna put back into position. It was my fault for not examining it more carefully during our windy season. When I took it down this spring, I replaced all the jumper wires and did lots of testing and tweaking to get everything just right. I have really terrific SWR readings on all bands now. The antenna is low maintenance and easy to work with. PLUS, the guys at GAP are really wonderful, if you need tech support or advice.

Hope some of that helps! Feel free to email me if you have more questions.

19269. Re: [FT897] Quick question about current draw on FT-897D

Yahoo group: FT897 (2007)
Date: 2007-07-01 14:21:48 UTC
From: Tim Lyons
Topic: 19258 Message: 19269

Here is what I have, on 20M, 10 watts, 5 amps, 20, 7, and 30, 8 amps. Now on 10M, at 10 watts, 5.5, 20 watts, 7 amps, and 30 watts, 8.5 amps. On 2M, at 10 watts, 4.5 amps, 20, 5.5 amps, and 30, about 6.5 amps.

Now those measurements are using the meter on the face of the of my power supply. I am using an MFJ 4225MV, and I would think the supply is pretty accurate. I will tell you though that the supply voltage drops to 13.0 VCD when I key up at 30 watts. That means to me the supply isn't that robust. But it does do the job.

In short, I would recommend that you find someone who will part with a decent power supply eventually. You will want to run the radio through it's rigors while under warantee. If you don't load the finals for a good long time, you will never know if the unit will fail after the warantee period. At least get a supply that will wring it out for a few weeks after you first get it. You have seen other reoprts in this group of folks that have had problems with the finals. I experienced the failure of finals 2 days after I unboxed my new unit in February.

You can probably find someon who will part with a good supply for less than 75 bucks. Do that and you'll be happy in the long run. Plus, when you really want to get through a pile up, you'll have the excuse to go buy a big ol Ameritron Amp knowing you gave it all you could with your radio barefoot. Trust me.

sholtofish <sholto@...> wrote:
Hi,

I am thinking about buying an 897 and plan to operate it on my
existing 10 amp supply. I realize this isn't going to give me full
power out but as I mainly do cw & digital at no more than 10-30W I am
hoping the psu will be adequate and I can save some pennies.

I was wondering if anyone could do a quick test for me? - transmit a
solid carrier at 10W, 20W & 30W and measure what the current draw is
from a 13.8v DC supply at each power output?

19273. Newbie question about SSB

Yahoo group: FT897 (2007)
Date: 2007-07-01 15:50:05 UTC
From: Dale Farmer
Topic: 19273 Message: 19273

I purchased my used 897 a few months ago. I mainly use it for psk and 2m/70cm fm with no problems. However when I try it in SSB, max output is 50W. I have adjust SSB mic gain with no effect to get it higher. I did enable PROC which increased to about 75W but I have my doubts on the voice quality. The microphone is a MH-31 and the 2.3khz filter is installed.

Is it something in the configuration, radio - malfunction, or the quality of the microphone.

Unless you use the correct measuring equipment, i.e. a peak
reading power meter, such as a Bird 4314B or a Bird 4391A, you
cannot measure the output power of a SSB transmitter.

A normal amateur SWR/Power meter is not suitable for the accurate
measurement of SSB power levels, nor in the majority of cases, is
the built in output power indicator of most amateur tranceivers,
including the FT897.

If you have access to a suitably specified oscilloscope it is
possible to display the peak waveform and with a suitable two tone
generator, one can adjust the microphone gain for optimum output
level. Otherwise, I would counsel against adjusting the microphone
gain without good reason

Increasing the microphone gain to achieve an indicated output on a
simple power meter is almost certain to result in a distorted
signal and possibly a damaged output stage. Don't do it!!

Geoff

Dale, I am a newbie also with this radio. The power level is adjustable. If you press the "F" key and rotate MEM/VFO to menu number 075 you will see RF Power Set. Rotate the main knob or VFO to adjust power setting then press "F" key again to program the 897.

I suspect your problem is RF on the OUTSIDE of the coax. The VSWR readings only deal with RF on the inside. I'm running my 897D with an outdoor mobile whip antenna about 20 feet away. I've noticed no problems on HF and none on VHF-UHF. Mind you, i rarely ever run the radio at full RF power....usually 25w on HF and 5W on VHF-UHF (except when working simplex over longish paths when I do run it full bore).

Now ANY radio with the possible exception of some old tube type receivers can be swamped by RF from another radio's antenna that's too close. The only cure is to filter out the offending signal.

19280. RE: [FT897] Thinking about Buying 897(WB2GLW)

Yahoo group: FT897 (2007)
Date: 2007-07-01 21:48:27 UTC
From: Mark Vaughan
Topic: 19178 Message: 19280

Yaesu cannot really rely on a statement of antenna distance to radio, at HF you are in the near field and all sorts of things can happen. This seems more like a Yaesu engineer just making a statement to get himself out of trouble. Some situations 50Ft could be the limit, some it could be more, some could be much less.

I have a Carolina windom in the garden that runs directly over the top of my car where my Ft857 is with it's ATAS probably about 15 feet between them.

I have used the FT857 for monitoring cabled back to the shack, whilst pumping 400W into the Carolina windom with a 1KHz tone, and various two tone tests.

No they have not been used exactly on the same frequency to do so would fry the front end of the 857, but it has been on the same band, and other bands during the tests.

The Ft857 never faulted, this was in Rx only.

It has also been used on field days, again in the vehicle with the Atas on the roof, but about 20 feet away from another operating a G5RV. Not on the same frq, but on the same band. In Tx and RX it never faulted.

I have worked in open fields half way up a hill with the ATAS bolted onto a tripod, 10m ground plane wires thrown out, whilst sat beside the tripod less than 6 ft away from the antenna and it was OK. Note this is not over the safe operating field strength, the field below the antenna has been measured and isn't too bad. Powered off lead acid gel batteries with a short ground stake. No car body to screen it this time just a canvas bag, again it worked perfectly for several hours until the batteries went flat.

I really don't think there is much difference between the 897 and 857 to make a substantial difference here.

If you are having problems, either you are in a very dangerous field strength, or something else is wrong. The radio may well be at fault, so also may be your grounding. These issues needing a good ground are common to many radios, and get worse as you start bumping the power up. Also a modern solid state amplifier within the radio will need much better matched SWR than an old valve radio most of which are quite happy beyond 3:1 SWR.

There are a few FT857's and Ft897's where the foldback thresholds are set too sensitive and trip real easy, Yaesu are not know for good alignment QA. They aren't too difficult to adjust, but you will need several dummy loads to simulate the require SWR threshold. Don't play with this unless you have the kit to do it.

Subject: Re: [FT897] Old Turner Microphones

I used to use one of those Turner microphones back in the CB radio days. I do have a D-104 hooked up to the 897. It is configured with a Heil HC-5. It sounds pretty good so I am told. I have a cat 5 cable hooked to it from the mic base.

Good luck with the setup. I think that Turner microphone is great looking. All you need to do is get one of those LDG meters and disassemble it, paint the box silver and set it next to the Turner and you get that "retro" look for the desk top.

19283. TX Error

Yahoo group: FT897 (2007)
Date: 2007-07-01 20:01:51 UTC
From: Andy Williams
Topic: 19283 Message: 19283

Hi all
I am a new 897D user and have had a problem twice with my radio.

I get TX error.

I have an LDG 897 tuner and an ATAS 120.

I can see that the ATAS becomes atas when I go out side amateur bands and this is usually accomapanied with a reluctance to transmit as in TX Error.

I can understand that TX error is the radios way of explaining that I am a dork trying to transmit outside of the allocated bands. OK I am learning and its good to have a Nanny.

What has happened twice now is a TX error everywhere. 145.600 is a repeater frequency and the little minus flashes up in the top left to tell me there is 600 offset, all well and good, but I get TX error the second I press transmit, also the ATAS is atas so the radio thinks its in a patch of out of band and Nannys me with the Uh Uh TX error.

I noticed that TX error is now radio wide, refusing to transmit on any bands at all. I tried the obvious like
Switch off
Change antenna
Disconnect LDG 897
Disconeect Diamond duplexer

The only cure is a full reset.

What am I doing to the radio to cause this system wide refusal to transmit?

I am using the batteries which slide into the case, but these are always 13.5 or above .

Help please
2E0NDY
Andy

19284. W4RT-ONE BIG PUNCH radio settings

Before you re-invent the wheel, I suggest you look at Hamlib, an Open
Source library for talking to a variety of radios:

http://hamlib.sourceforge.net/

In theory, if you use Hamlib correctly, your app will be able to talk
to any radio supported by Hamlib.

There are a couple of points here; firstly the ATAS120 is designed to work without a tuner so make sure that the LDG897 is not in circuit when tyring to use the ATAS120.

Regarding the TX ERROR on 145.600, does this only happen when you are on a repeater channel? If so it sounds like the repeater shift has changed to greater 600kHz and it is taking you outside the 2m band. Check that the shift is set to 600kHz.

Regards
Jeff

Hello Andy,
Check that you've not got split operation accidently enabled,
it might be trying to use a vfo on Tx which is out of band.

HI
Thanks for these tips.

What happened seems to be a radio wide reluctance to transmit, all bands,
any frequencies.

I admit my lack of expertise and may well have inadvertently made changes
when in menu mode. I noticed, my hands shake a little, that when I am
changing the menu number on vfo I can sometimes nudge the big wheel by
accident, so as I race past I have made changes without knowing where or
what the □proper¹ setting should be.

My only solution is to do the □system wide¹ reset.

However I was making one mistake. I have a diamond duplexer and was feeding
the sum of the 2 outputs into the LDG897 and couldn¹t work out why I wasn¹t
hearing anything on 144 or 433. I spent ages fiddling with pass through and
full tune on the LDG897 and the ATAS and gave up by manually isolating the
Antenna Tuner every time I wanted to use VHF. Of course REAL radio Hams
Don¹t read manuals and neither had I. 2 weeks later and a lot of fiddling
out came the paperwork and shock horror the LDG is only supposed to work up
to 50Mhz, by now of course I had it working on 144 and 433 but not reliably.
□Ah well¹ at least my cat said □I told you so¹.

If I get the system wide error again I will check the spilt operation etc

Thanks

Andy

Hi Andy

Maybe I am misunderstanding your set, as you don't specifically say how you have things connected, BUT if you are using the ATAS120 you shold not be using the LDG897 at all.

The ATAS 120 has its own built in tuning mechanism and does not require an additional tuner. The LDG897 is used to tune wire antennas not the ATAS 120. I am not sure if the by-pass path in the LDG897 has dc contunity, if it does not then the ATAS will not tune. I would take the tuner out of circuit when using the ATAS120.

Now that¹s an interesting comment.

This is supposed to be the ultimate portable rig. I asked for something I could take camping, erect for a weekend or so and do some radio. I was given a vehicle trap foot with 4 5ft swaged poles, an atbk counterpoise, an atas 120, an ldg897, a diamond duplexer, a long piece of coax with a clamp for the pole and a 259 plug mount for the atas, and the ft897 with batteries and a charger. I did not research or spec any of the items other than the definition of high portability and independence. My mistake for being so vauge.

What I found was, that if I earthed the ft897 to ground I could get the LDG897 to tune to zero SWR for 144 and 433, this was a short wire and a tent peg. It has been exceptionally wet here in the UK for the 2 weeks I was away. I made contacts on 7mhz 14mhz as well as 144 and 433 through repeaters.

From: kc3vo@aol.com
Topic: 19291 Message: 19291

If operation of a device, such as a tuner, radio, amplifier or antenna is attempted outside the advertised/specified ratings/frequencies, it MIGHT still work, but its operation, and QUALITY/RELIABILITY of operation cannot be guaranteed! This means that such operation may or may NOT be satisfactory and repeatable. Such things as lead length, type of antenna, radio SWR tolerance, grounding, etc. become more problematic as operation beyond specifications is attempted. The ATAS antennas are NOT designed for below 7.000 Mhz. operation, and the corresponding YAESU radios will not transmit below 7.000 Mhz. when properly configured for the ATAS antenna operation.---73, KC3VO-Bob Curry

Andy

I think you need to understand the equipment that you have purchased
a little more thoroughly.

The ATAS 120 is primarily a mobile antenna that covers HF, from 7MHz
up, 144 & 433MHZ bands, and works when mounted on a vehicle, which
provides a groundplane.

The ATBK Counterpoise allows the ATAS120 to work on 144 & 433, but
not on HF, when not mounted on a vehicle.

To get the ATAS120 to work on HF off of a vehicle you need to add a groundplane or long counterpoise wire, possibly more than one counterpoise if you want to work on more than one band.

When set up correctly the motor in the ATAS 120 will tune the aerial to the correct position for hf, or fuly retracted for vhf/uhf. No external ATU is needed.

The LDG897 is used if for example you were to sling a dipole or a G5RV from your mast, as you say it is not designed for use on vhf/uhf, and indeed you should not need it.

When using the ATAS120 you should be able to just press the Tune soft key and the ATAS120 will move up and down and tune for min VSWR.

Thanks Jeff

I will try the long wire counterpoise dangling from the mast next time I¹m out.

The ATBK has 4 elements 1 medium and one short plain element and 2 identical long elements with built in coils. I assumed the 4 elements gave full coverage across the whole ATAS 120.

Just shows how much I have to learn on my 2E0 licence (I took both exams at the same time). I love the new hobby, it has ,for me, the perfect blend of practical and theoretical. Its the thrill of the chase and discovery. I am like a cheshire cat :)

Thanks for all the help

Andy

Hi Andy

Try a counterpoise wire 1/4 wavelength long on the band that you wish to operate on. If you are vert lucky the mast might work on as a counterpoise on one band.

19296. Re: [FT897] Problem loading ATAS-25 antenna on 40 meters

Yahoo group: FT897 (2007)
Date: 2007-07-02 18:06:39 UTC
From: Johnny Burroughs
Topic: 19294 Message: 19296

Greetings,

I only use the ATAS-25 'stick' on 40m. I use it when go away on holiday and have had great success with it reaching up to 1600km with a 5 7 signal report @ 100w. I haven't tried it further but it does what I need it too do. The antenna stands on a camera tripod on the balcony of my holiday apartment with the ground radials looping around the balcony and the apartment, the long radial, hanging over the balcony rail.

To answer your question: I use an MFJ259B to assist in the adjusting of the antenna to a specific frequency. The FT's meter indicates the absolute minimum SWR. I can easily tune the antenna down to 1.2:1 and have even had better on one or two occasions but in the apartment, nothing better than 1.2 :1

The only advice I can perhaps give you is to stand well clear of the antenna after each adjustment. Your proximity can affect the antenna's tuning. Also make sure your length of coax is cut to an electrical half wave multiple as it acts as a narrow band 1:1 transformer and thus has no effect on the effectiveness of the antenna. Whereas an incorrectly cut coax will reduce the effectiveness of the antenna.

73, Johnny.

hello
i am connecting the fc 30 to the 897.
in our files - there is a photo of soldertype 90 degree pl259 (really not a 259) connector
used with short , exact fitting cable.

anyone know part number, mfg, or source to get them?
the very nice short cable, terminated by solder right angle connectors make for high quality
installation

thanks

From: dalite01@bellsouth.net
Topic: 19260 Message: 19299

You can chose a smaller magnification of the waterfall to increase visible bandwidth.

Better yet, simply go to View->> Spectrum->> and select Sound

Then you will see the audio bandwidth and eliminate the confusion.

When you select the frequency, 3KHz is the total bandwidth of both sidebands.

For example, a center frequency of 14.070 would yield a LSB Dial Frequency of 14071.5 KHz and a USB Dial Frequency of 14068.5 KHz. When you subtract 14068.5 from 14071.5, you get the 3KHz bandwidth possible.

Conversly, a dial frequency of 14070.0 KHz in USB node will be center frequency of 14068.5 KHz; in LSB Mode, the same dial frequency would be a center frequency of 14067.0 KHz.

You may not need an isolation transformer. Try it with none.
However a system designed for use with any
computer/soundcard combination isolation is best. Many folks
use lap tops some desk tops. Some brands are prone to ground
loop induced noise/hum than others, your milage may vary.

Hi Jeffrey,
I use the batteries and they have been terrific. It would be quite an odd situation for two batteries to be bad so I think it must be something else.
Is the outboard power supply cable connected to your radio when you try to use the internal batteries? If it is, the batteries won't power the radio--even if the outboard supply is off. The batteries only come on if no other dc supply is connected (on or off).
Disconnect the dc power supply cable and the batteries should power the 897. The switch on the top right of the rig controls which battery will be in-line (A or B).
You can power the radio with an outboard supply with the internal batteries installed, but remember to disconnect the power supply cable when you want to use the internal batteries.
I ran my 897D for Field Day all day Saturday (I averaged 10 Watts ouput on cw), and the batteries didn't require a charge until the end of the day.
I hope this info helps!

PTT is used to switch the TRANSCEIVER from receive to transmit, NOT for external devices! What you want is called "TX GND"-this terminal takes external devices to ground during transmit, and is used to control external amplifiers/relays.-73, KC3VO-Bob

Huh? Sidebands are the full 3 kHz above and below the center
frequency. This is why if you attempt to transmit at 14350 with USB,
you'd actually be transmitting at 14551.5 +- 1.5kHz, or you would
definately be out of band. However, if you transmitted LSB, you'd be in
band from 14348.5 +- 1.5kHz.

Check out: http://en.wikipedia.org/wiki/Sideband

Each sideband has a full 3 hHz bandwidth, with everything together (both
USB and LSB) you get about 6kHz bandwidth, which is AM modulation.

But getting back on topic, the best results for PSK31 in the waterfall
lies between about 750 - 2500. Yes, you can operate above and below
this a bit, but from my observations, the power output is reduced.

I would think that there is a need for an isolation trabsformer or
two on safety grounds, along with an opto-isolator for the TX
line. Imagine a situation where the radio is earthed to a good RF
ground but the PC is grounded to a power supply ground.

If there is a ground fault which takes the ground wire a few volts
above earth, not uncommon in these days of PME, there could be a
significant current flowing through your radio, through parts not
designed to carry such current.

Ideally, you should have all grounds (RF and supply) connected
together but this is not permitted in PME installations.

Err, no. It is a matter of definition. In upper sideband mode,
theoretically (and in a properly adjusted transmitter) the
sideband will extend from between 200Hz to perhaps 2.7kHz above
the carrier frequency. For lower sideband mode the sideband will
be below the carrier frequency by similar amounts. The actual
limits will be dependant on the transmitter.

Again, theoretically, you couls put the carrier on exactly
14.000MHz and transmit USB. To do this, you will have to have
great faith in the frequency calibration of your transmitter, and
a skin thick enough to withstand the 10 million or so CW operators
that will be crawling all over you.

Although the wiki definition correctly refers to the carrier
frequency, some (many) amateur equipment manufacturers do not use
the carrier frequency as the 'tuned to' frequency, instead using
the centre of the sideband, as you describe. This is wrong and
should be avoided.

> Each sideband has a full 3 hHz bandwidth, with everything together (both
> USB and LSB) you get about 6kHz bandwidth, which is AM modulation.

Again no, is SSB, the sidebands occupy typically 0.3-2.7kHz above
or below the carrier

I would add, although LSB is accepted practice below and USB above
10MHz, in data modes, USB is always used.

I agree Geoff

Regarding household earthing problems and RF earth connections.

There is a little exception though regarding connecting your RF earth to the PME earth.

The risk comes if the power company makes a muck up and accidentally allows the PME earth to lift, for instance connecting Neutral to a phase, or swapping Live and Neutral.

It is seen bad if the RF earth is commoned since hi currents will flow through the house earth system, possibly higher than it can take resulting in a cable fire, and you aren't allowed to fuse the earth line. This is only an argument scene by Hams, no other group recognises is.

Problem with this argument is that many other earthed things are bonded to the PME earth like water and gas pipes, many enter the ground and could carry equally hi current under fault conditions again resulting in a household cable fire, though their earth conductors are supposed to be bigger than a normal ring main.

Some argue that the fault never occurs, even the RSGB argue this, but I know of several circumstances in my county alone where we have seen 415V between Live and Neutral, with the power companies earth bonds blown, and many household appliances in a whole village.

If you make your RF earth really big, bigger than the electricity boards incoming PME tap, then should a problem occur the cable fire will not be in your building, but on the power companies line. The power companies don't like this, but to hell with them, it's their fault that causes the problem. My RF earth is 25sqmm silver plated fine copper RF welding cable direct from my RF earth stakes, via the shack to the main PME earth terminal. The power companies and Part P electrical boys also hate earth wire that is not green and yellow, but green and yellow standard mains earth is no good for RF. That's my solution anyhow.

Regs Mark

PS I have run my PC direct into the audio inputs of my radio's without transformers and did not get a problem, but a transformer is the professional way to do it.

Hi Celito,

If it's the hidden service menu settings you want then all radios are likely to be different, many of the settings in that menu are specific to your particular transceiver and are dependant on other menu values.

If you are wanting to change anything please bear in mind that it needs to be carried out against a reference voltage of exactly 13.8V.

Regards

Andrew - G7MNS

Sorry, but NO, there is no way, other than re-alignment, to restore factory settings and performance! The service menu is not to be tampered with, as if done improperly, values become changed, and radio must be re-aligned with proper power supply and test equipment, as described in the YAESU service manual, to restore these settings, as they are DIFFERENT and unique to each individual radio!

73, and good luck, KC3VO-Bob

Totally agree Mark, and this I believe is the reason why the rules
regarding PME (i.e. no independant earth) are so.

The major problem is the 'garden tap'. Whilst inside the 'earthed
cage' of the house, where even wet floorboards are at
equipotential, the problem comes at the outside tap, where it
could be at line potential. If you have been watering the garden
and have wet sandles on a wet lawn, and reach across to turn the
'live garden tap' off, then you are the path to the real earth!

I believe that the RSGB are taking the line of least risk. I have
been party to some discussions where the RSGB have admitted to
there being a problem, but if they follow the published IEE
recommendations, then they can slope shoulders. The RSGB could
commission an FIEE or the like, (or a uni) to produce some
alternative recommendations, but they are frightened of spending
money.

Hmm, I am glad that a) I do not operate LF, where these earths are
necessary, b) I am not in a PME area - we are on an underground
feed from the non-switching sub about 30m away.

The only RF earth I have is a 3m 15mm pipe buried about 50cm from
the foot of the mast. It is connected to the bottom of the mast by
some 1" by 1/4" copper braid ex Marconi.

I am a little paranoid about lightning, but with the mast winched
down it is below trees etc. all around so I don't worry.

I once had to look at a church audio installation that had been
damaged by a lightning strike. The church tower was ditted with
the standard lightning conductor, something like 2" by 1/2" copper
strip to a good earth and it performed its job magnificently,
apart from a few scorch marks no damage was done. However it
appears that the induced current had destroyed the wiring inside
the tower - screw barrel conduit run parallel to the lightning
conducter, with about 3ft of stone between the two, had been blown
off of the wall.

The church's PA system, the main amplifier of which was mounted in
the bell-ringers room (whatever they call that) was completely
destroyed, but the main amplifier itself, which was all valve, was
completely unharmed, except the mains and input cables were
vapourised. Whoever had installed the amplifier had grounded it to
the speaker cable conduit which ran up and down the far side of
the tower from the lightning conductor.

I have actually seen a lightning strike from about 50m away, an
11kV overhead line was struck as I walked along the road and a
discharge ran along the overheads going to ground right in front
of me. Luckily, I was on the right side of the road because that

was real scary.

73 Geoff

PS, there is a right old rattle-banger going on outside right now!

Hi Geof

I□ve had quite a few lightening hits.

It melted my CB mast which sagged then all the guy□s went loose and it fell over.

When a storm approaches it is normal to dive in the shack incase anything has been forgotten. I remember a few years ago, there was a little thunder noise, seemed way off, so I unplugged the antennas from the radios, with the pL259 still in my hand I watched a lightening strike hit the three phase power cables at the bottom of the garden, the flash jumped from phase to phase, then I though Ooh this is about 10 feet away from the antenna to which I am holding the plug. I dropped the plug as the lightening jumped across to my antenna, the plug was about 18 inches to two feet from my hand when the flash lept off of the PL259 to me. Threw me across the room. Oooh I said (**?!£$&%). I now have lightening arrestors, big GDT□s and gaps as the antennas enter the house grounded with two 25sqmm cables to my RF stakes.

A few weeks ago another storm approached, all antennas disconnected this time. I also unplugged all the computers and other kit from the mains. I was coming down the stairs when the lightening hit the telephone wires. Sparks flew out of my broadband router and down onto the filing cabinet below, lit the whole hall way up. Surprisingly it all survived.

Regarding PME, the RSGB and part P testers. As the representative body the government would accept any guide lines the RSGB issued. Also for Part P you need to be registered with an approved body, Part P causes a problem for many hams, and is Corgi can approve gas engineers, and Oftec oil engineers to play with electrics, then I think the RSGB could certify hams, with a little training and construction of test kit. I have suggested this many times to the RSGB but they see no point.

If anyone watching thinks this is a good idea, perhaps they could shove some emails up the pipe line, if we don□t get approval, it won□t be long before some council rejects out ham installation on grounds that it cannot meet part P as directed.

My 897 along with a Buddipole ant and the rest of the station gear go along on my camping trips. I so far have been at campground where I had power and so used a power supply and not batteries. The radio has been splendid on the two outings I've taken since I got it in April and it campaigns on here at home.

I've not regretted my choice one bit.

I am curious what type antenna systems people are using with their
FT 897 radios. Is anyone using all the bands the radio is capable of.
I currently have a 2m j-pole I am using for 2m and 70cm and a G5RV
for 10 to 80M. I am not sure what I need to consider for 160 and 6M.
Next Wed is payday and I will order a FT897.
Thanks

Right now I'm using a Carolina Windom 80, the center is up about 35 feet in a walnut tree and the end are at about 20 feet tied to other trees with the LDG-100 tuner I can work 80 thru 6. I run a twin lead jpole in a pvc weather enclosure for 2m and 70cm FM. Out and about I use a Buddipole for 40 thru 2 and if there is room for the counterpoise (apprx 67') I set it up as a Buddistick with the low band coil an work 80/75.

I'm somewhat lazily using my ATAS-120 on the truck or in the attic. It's not the best residential antenna, but I've been swamped with "real" things I need to do to the house that take precidence over setting up a bigger antenna.

It works, not perffect at all, but it does work.

19323. Which Heil Microphone is best for the FT-897D?

Yahoo group: FT897 (2007)
Date: 2007-07-04 05:37:55 UTC
From: paulcbg
Topic: 19323 Message: 19323

I'm confused by the variety of Heil microphones and connectors and wonder which one is best suited for the FT-897D? I gather I need the CH-1 YM Yaesu Modular (adapter or is it a cable?) but then there is the AD-1-YM (Modular) adapter also. The microphone choices include the HM-4, HM-5 and HM-Pro and possibly others.

Could someone please clarify what's needed and what is recommended for optimum audio quality on the FT-897D?

Thanks,
Paul BG

From: dd7zt
Topic: 19323 Message: 19324

Hi Paul,

it depends on what you prefer to do. The HM-4 is called the "pile-up breaker". If you prefer to do some small talk with your friends on shortwave you should order the HM-5 because it has a wider audio range. I just get the HM-4 for my FT897D and am very satisfied with it. However in each case you need the connection cable for your TRX. For the 897 it is the CH-1 YM. The AD-1... is used for the headsets.

What ever you will decide to buy, it will be a good one ;-)

73s,
Frank, dd7zt

Paul, I had that same question until I came across the W4RT One Big Punch with Heil elements HC4 & HC5 all enclosed in the MH-31 original microphone. Go to the www.w4rt.com site for more information, I got the best of both world plus the speech processor. I use the HC4 with the speech processor for pile ups and the HC5 without the SP for local and FM on 2m and 440cm.

good mornin
i am usin the heil traveler boom mic head set with my ft 897d and i really like it.
a couple things to remember the yaesu modular adapter comes with a 1/8 in plug for the receive plug and it takes a 1/4 in so i got the 1/8 to 1/4 adapter at rad shack and it works fine.
also you will have to back off on the mic gain in what mode you are transmitting in, i.e. fm ssb etc.
my fm gain is set at 6 and ssb is 6 also.
hope this helps

19327. Tuning Problems FT897 with AT897

Yahoo group: FT897 (2007)
Date: 2007-07-04 14:18:28 UTC
From: gastbury
Topic: 19327 Message: 19327

Has anyone had problems trying to get the AT 897 or any other auto tuner to tune on all bands with their FT897?

I am having problems getting mine to tune on 6m 10m 12m 80m and 160m.

I'm testing it with a purely resistive dummy load (150 ohms). Haven't had a chance to test it with the G5RV. It has been suggested to me that I could have RF problems or grounding issues. I wouldn't t hink I would have these with a dummy load.

Any assistance or thoughts appreciated.

19329. Re: [FT897] antennas

Yahoo group: FT897 (2007)
Date: 2007-07-04 15:16:07 UTC
From: K6LMP
Topic: 19318 Message: 19329

I have a mix of antennas that I use under various circumstances. The primary HF antenna at the home QTH is a 40 meter horizontal loop. This antenna has the advantage of offering a low SWR on 40, 20, 15 and even 10 meters without a tuner, and several dBi gain over a dipole It's a bit of a "cloud burner," when mounted 40 feet above ground, but if you can raise it to 60 feet or so, the angle of radiation improves significantly.

For fixed station 2 meters/440 non-mobile, I use a dual band j-pole. several home-brew versions are described on the Internet. email me offline if you want links. I can also have 2 meter and 440 yagis that I can mount on the roof, and a 6-meter 3 element quad (see below).

I also use the rig mobile in my daily commuter, primarily on VHF-UHF for repeater work, with a small dual-band whip (small for clearance purposes in parking garages, though less efficient than physically larger antennas). I also have a set of HF single-band verticals (Hustler) mounted on a fabricated bracket that bolts to the frame and mounts the antennas near the right tail light. The Hustler system offers 6 meter capability with no coil attached, and has resonators for every HF band except 60 meters. They can be tuned to any given frequency, but the 2:1 SWR bandwidth is quite narrow (25-30 khz on 80 meters, up to 150-250 khz on 10 meters. However, I am able to tune pretty much across the band by using the Yaesu auto tuner with this set of antennas. it has trouble tuning 6 meters (it gives a "HIGH SWR" warning because it hits the tuning limit, but the actual swr is under 1.5:1 at 50.125 and 50.300). Because of ignition noise, I mostly use the rig in mobile operation on 6 mete FM.

I also use my 897 as the basis for a VHF rover station and all-band mobile station. I have an unusual offroading vehicle (an Austrian-made Pinzgauer 710M, which is basically a pickup truck with very high clearance and lockable axles), which has become the base for a high performance VHF mobile station. I have built high-gain Yagis for 2 meters and 70 cm, which mount on one mast with a rotor, and 3-element 6 meter quad on a separate mast. For mobile/portable use, I also have Yaesu's ATAS 25 (a "hiker antenna") that is supposed to tune 40 through 6 meters, plus 2m and 70 cm, but I have difficulty achieving a good SWR on 40 meters, so I also carry a 40 meter folded dipole made from 300 ohm TV antenna line (see Ch. 15 of ARRL antenna book for details).

The 897 is a very versatile rig, and the antenna of choice depends on the situation in which you're using it. I use it at my home QTH, in my commute vehicle, as a rover/portable station in the Pinz, and as a fixed-base station at a mountain cabin I own. Different antennas in

each case, as the installation conditions require. (the cabin is on national forest service land, and I am now allowed to install any permanent antennas there, so I go with the ATAS 25 and 40 meter dipole). '

of.

My guess is that most people use at least two or three antennas with their FT-897s. There probably aren't too many SteppIRs on 100 ft towers. If you can afford that, you'll want to spend $3,000+ on a higher performance radio. As for me, I can't use permanent antennas, so I use an Elk 5-element log periodic for 2M/70CM SSB, a J-pole for 2M FM, and a Par moxon for 6 meters. These are mounted on PVC pipe not more than 12ft off the ground. For HF, I use an ATAS-120A on a tripod.

Running back yard portable, I've confirmed 65 countries since last October and I've worked 106 grid squares on 6 meters. My best distance on 2 meters was 284 miles in the June VHF QSO Party (using a 200 watt amp). I doubt that I'll ever work 80 or 160 here, given my cramped lot. Still, I've got enough frequencies available to keep me entertained.

19331. Details on MH-59A8J microphone operation

Yahoo group: FT897 (2007)
Date: 2007-07-04 14:32:00 UTC
From: Richard Merhar
Topic: 19331 Message: 19331

I think it would be interesting to find out how the MH-59A8J remote mic works, so an FT-897 owner could build their own inexpensive remote control keypad. This would be great for a home station. Does anyone have any details on how the microphone communicates with the FT897? It looks like some CAT comm protocol, but not sure what the control codes would be.
Any one?
Tnx

Nothing is wrong with the radio, you simply need to set the 6 meter repeater shift. See your owners manual, and set it for 500 Khz.(instead of the present 1000 Khz)--73, KC3VO-Bob

Most 6 meter repeaters are either a 1 MHz or 1.7 MHz shift. Your radio
is set for the 1. You can set the shift in the menu to 500 KHz if that
is what you need. Are the 6m repeaters where you are using 500 KHz?

19338. PSK 31 Interface Cables

Yahoo group: FT897 (2007)
Date: 2007-07-05 01:09:55 UTC
From: tolhens
Topic: 19338 Message: 19338

Hi,

Can you use the FT-897 on PSK using the optional packet cable listed in the owner's manual? Or do you need an interface such as the commercial ones?

I have an interface which worked with a Kenwood TS570 (popcorn processor noise galore on receive on SSB/CW).

Ten Tec supplies a cable with the Jupiter which plugs into the ACC1 slot and eliminates the need for an interface.

Does the optional Yaesu packet cable accomplish this?

Or is there an outside source for such a cable which might work?

Thanks,

Rick

19339. Re: antennas

Yahoo group: FT897 (2007)
Date: 2007-07-05 01:13:00 UTC
From: mrmsudawgs
Topic: 19318 Message: 19339

I highly recommend a horizontal loop antenna for the following reasons:

(1) Inexpensive
(2) Easy to build (just wire)
(3) Easy to hide from the neighbors
(4) If long enough, can work all bands with it.

I have a 550 ft long (160 Meters) full wave horizontal loop antenna. I have made contacts on all bands in various modes using it and my FT-897D. In essence, it is simply wire strung through the tree branches.

Here is a link showing all the contacts that I have made since Jan 2007. The photos are arranged by Bands worked (160, 80, 40, 30, 20, 17, 12, 10, and 6). I only have two contacts on 10 and 12 so their photos are not shown.
http://picasaweb.google.com/mrmsudawgs/StationsWorkedByFrequency

Also, you can click the following link to see photos of the actual loop itself. It is difficult to see in the photos but it is there. Look closely.
http://picasaweb.google.com/mrmsudawgs/SkyLoop

For 2m / 440 I use a 1/4 wave mag mount mobile antenna in my attic that is stuck (magnetically) to a piece of sheet metal. Works gang busters!

Best Regards,

Mike

Mine does the same thing but it is not supposed to shift on transmit. I don't recall this portion of the 6 meter band being a "repeater" band requiring an automatic shift. I think your rig is working fine.

Mike

I joined Army MARS a little less than a year ago and have really enjoyed it. If your FT897 was made before August 2005 you can do a software mod. If it a later model you can only mod it with the hardware mod. If you are not REALLY good at soldering small components I suggest you have Yaesu do the mod.

19353. homebrew interface cable

Yahoo group: FT897 (2007)
Date: 2007-07-05 21:04:22 UTC
From: Shawn Hawkins
Topic: 19353 Message: 19353

I have a set of Cyber Accoustic head phones/microphone. It is a USB headset and they broke. I would like to use them in a homebrew project like a CAT interface cable for my FT 857.
The wiring of the headset is such:
red and sheild=Microphone
gold and red copper= left ear
grey and gold= right ear
When I plug in the USB plug it registers as a USB audio device.
It looks to me it would be a perfect sound card interface cable but I am not sure if I would need some kind of a buffer between the computer and the radio. I think I would use one of the data jacks on the back of the radio like the CAT but I want to be sure of how to do this and which pin on the jack to hook to which wire. Can someone smarter than me help me out with this?

19354. Re: Interfacing the FT-897D to an Amplifier

Yahoo group: FT897 (2007)
Date: 2007-07-05 08:23:58 UTC
From: yveson4kcy
Topic: 19235 Message: 19354

I connect my amplifier only by mean of the ACC 3.5mm plug.
It works great !

Change position of jumper J1027:
By default jumper is in position 1-2 = TXREQ and need to put it in position 2-3 = TX-GND (this is indicated on the printboard)
To find it: Open upper cover of the FT897 and find the jumper about 4 centimeters to the right from ACC connector.
I can send a picture if needed. Just ask for it.

I use a cable with 3,5mm stereo connector on one side and RCA connectors on other side.
Tip of the 3.5mm jack: ALC
Ring: TX Ground
Main: Ground

19355. Re: antennas

Yahoo group: FT897 (2007)
Date: 2007-07-06 01:59:54 UTC
From: mrmsudawgs
Topic: 19318 Message: 19355

Gene,

Definately use 450 ohm ladder line. To keep the RF out of the shack, use two parallel runs of coax from your tuner to the ladder line awaiting outside your home. Connect the center conductors of the coax to the ladder line - one center conductor to one leg of the ladder line then the other center conductor to the next leg. Connect the shields of the coax together and ground them to your tuner (which should also be grounded). This setup will allow you to pass the coax through the walls with no effect on signals since the coax is shielded. I use it and it works great!

My tuner has a balun so I did not have to make one. I use the MFJ-969 Tuner.

Refer to my post in eHam.net for additional information. My eHam Post <http://www.eham.net/forums/Elmers/149648>

We can take this conversation outside the group if necessary. Just send me an e-mail to my callsign at arrl.net.

19363. Re: [FT897] Re: antennas

Yahoo group: FT897 (2007)
Date: 2007-07-05 21:25:28 UTC
From: Lew Phelps K6LMP
Topic: 19318 Message: 19363

I also use a horizontal loop antenna, and mine is fed by coax, not ladder line, so I thought I would chime into this discussion. Because of space constraints, mine is a 40 meter loop.

The basic technique for matching a full wave loop antenna to 50 ohm coax is to include a matching section of 75 ohm coax connected to the antenna, cut to 1/4 wave length (taking the velocity factor of the coax you're using into effect). To be specific, if you're setting out to build a horizontal loop tuned to 7.15 mHz, the total loop length would be 140.56 feet. Assume the matching section is made from coax with a velocity factor of 0.80. The 75 ohm matching section would thus be 140.56 /4 * .8 - 28.112 feet. There's a wavelength calculator online at http://www.geocities.com/kk5hy/calc.html.

You appear to have enough room for an 80 meter horizontal loop, but not for 160 meters. I have not done this with my 40 meter loop, but I think it would be feasible to install a relay in the loop, at the halfway point around the loop from the feedpoint, and switch the relay to Open position, converting the loop from an 80 meter full wave loop to a 160 meter dipole. It wouldn't be as efficient on 160 as a dipole stretched out to full length, but it's better than nothing.

The "sky loop" is written up in the ARRL Wire Antenna Book. Dick Cebik also has an extensive discussion of loop antennas at http://www.cebik.com/wire/horloop.html. There ave also been a number of articles in QST over the years; see the ARRL web site (members only area).

From: Ken Bandy
Topic: 19361 Message: 19366

I haven't had any dealings with Gigaparts, but I would highly recommend against getting the FC-30 tuner. Get the LDG AT-897 instead. Trust me, I originally bought the FC-30, and a few months later bought the AT-897. Wider tuning range is the main reason. If the FC-30 sees a mismatch higher than 3:1, it won't tune. The AT-897, on the other hand, will tune up to a 10:1 mismatch.

However, if you really want a FC-30, I have a lightly used one for $100;-)

Just a comment, the FC-30 will only tune cases in which SWR is around 3:1. If you plan to experiment with antennas, I would recommend the AT-897 from LDG. I had the FC-30 and although it is a better match for the radio, the AT-897 allowed me more freedom in trial and
error and also provides you with another cat socket so you do not really loose it.

my $0.02

From: Phineas Henshaw
Topic: 19373 Message: 19373

I can agree with the rest of the posters to a point. I have had great success with the FC40 in a FIXED operation, with the right length of wire, good gounding, etc... However, I wouod not recommend it for situations where things are going to move or change. For example, an auto installation with a 102 or longer whip, with a good counterpoise/body ground. The FC tuner is great for that. However, take it to the park for emergency comms, where the setup changes almost everytime, forget it unless you use ladder line! This is where tuners like the LDG tuner really shine. There is definitely a lot more flexibility in less than perfect and changing conditions.

Just thought I would add my 2 cents

Also, the prices for the 857 and the 817 are dropping also. Maybe sales have dropped? Over production based on projected sales? Who knows.

Yow! I paid about $829 for my FT-897D last June. I see the FP-30's are $188, just like I paid last August but you have to use PayPal unlike last year. Even the VX-7RB's are on sale at $289. Paid $299 for mine in January.

Phineas:
I'm curious why you would say that the FC-40 would not be suited for temporary fixed operations (park for emergency comms) and why you say to that ladder line would be the only solution. What would be different about the LDG tuner in this situation that would make it more suitable?

I would call AES and tell them to either drop their price and issue you a credit OR refuse delivery..They have to refund you full amount as package never delivered. Gigaparts will give you free shipping also..You can also buy the 857D for $610.

19379. Best PC/Rig Interface

Yahoo group: FT897 (2007)
Date: 2007-07-07 17:22:10 UTC
From: Adam Filkins - KD8CCX
Topic: 19379 Message: 19379

Hello All,
I was wondering if anyone could recommend a PC/Rig Interface for my 897D and my PC. I would like to do APRS and PSK-31, and in reality would eventually like to get into slow scan and other digital modes.

Any help would be great. Thanks!

73's,

Thanks for all the coments. I ment fp-30 not fc-30. Friday I went to HRO to see if they would give the same price. They would not BUT they had a FT-897D open stock for $720. I bought it with the fc-30. Total cost me $10 more and took it home with me. If in the future I am buying any thing will check Gigaparts. 73 Wally W1IOO

From: k6daf
Topic: 19381 Message: 19381

I am installing my HF Gap antenna in the back yard and running the coax RG-8X along the house and into the garage.

Question: We have Cox cable TV and when they installed their coax they ran it around the house about 10 high on the walls. If I tie wrap the HF coax to this TV coax will I be creating a reception problem with the TV's when I transmit on the FT-897?

Thanks for any help

Charles

The tuning range is the main issue I have with the FC tuner. Because of the tuning range of the LDG
it give you more options as far as when you can possible use as an antenna.
If you used,for example, a G5RV as your emergency antenna, then the FC would work fine. However, You would not be able to tune up a fence, gutter, flag pole, etc.... unless its length was within the limited range of the FC tuner. That is all I was trying to say.

As far as ladder line, it is a known fact that ladder line is easier to tune than coax. Partly due to the low loss, and the fact that it can almost seem to match itself. With Coax, you really have to do more to ensure your antenna is the right length.
Just as a gag, a friend and I sat around and played with antenna ideas, with ladder line, coax, zip cord, etc.... with different materials. By far, the twin lead was the easiest to tune.
withe the least amount of impedence mismatch. We tried an balanced antenna made out of 2 doorknobs.
Even though the SGC could tune them, but the FC could not on COAX, but switch to ladder line, it
tuned right up! (Yes you can actually send a signal from a door knob dipole!)

Short answer: Probably.

Explanation: As with any other type of "antenna" wire, the Cable coax will pick up RF signals. Cable TV, being "broadband" TV, will most likely sustain interference with the HF coax being that close. Especially if the tech who installed the system did not properly tighten all connections and did not properly ground the cable system (since the techs usually do not take into account other RF making "appliances" in the vicinity). Your best approach is to keep the 2 runs separate as much as possible.

Good luck!

Dennis - N8BMB

From: Mark Vaughan
Topic: 19381 Message: 19384

It will also depend significantly what type of antenna you hang on the end. Most HF antennas long wires, windoms, G5RV's etc are tuned in the shack which means there will be a high probability of significant amounts of RF on the outside of the coax. If the HF antenna is tuned for each band the RF on the exterior will be significantly less, which will permit a smaller separation distance, grounding the RF coax at the base of the tower before it comes alongside the cable TV cable will also help reduce the problem.

But as Dennis says side by side and you will almost definitely get some cross talk problems, especially with the quality of work from most cable guy's.

There are higher quality coaxes which can help like Andrews heliax but it will be much more expensive that fixing a few feet sway from the first cable.

You may even find ladder line will be cleaner than coax because it is balanced, if you keep the cable tv coax clear of the local field between the ladders it will be reasonably clean. Your going to have to resourt to some trial and error.

I suppose if you had the 857 instead of the 897 you could put the radio on the mast and remote the head to the shack.

They're a first class operation. They're usually my second choice mainly because HRO in Atlanta, GA is just as quick shipping to my QTH and there's no sales tax. If I buy from Gigaparts I have to pay state of Alabama sales tax.

Coax is shielded so you should be just fine. You can play it safe and put as much distance between them as possible but a "shielded" cable is just that - "shielded". By nature, they do not emit RF (at least not much) so you should be ok.

Most interference problems aren't caused by leaking coax.
That is if the coax has a good braid cover. I've seen some
cheap coax with less than 90% shielding! Interference
problems from coax running near by is mainly caused by RF
riding the outer shield due to improper matching or
decoupling at the antenna.

I use a SignaLink USB. It's a USB soundcard designed for radio
and mine came with a cable for the 897D's rear accessory port.

It works nicely for me but I have to disable my internal
soundcard for some of the ham software to see and use it.

As for me, I using my homebrew Digi-CAT.
It's a combination of Digital interface for PSK, RTTY, SSTV, Echolink, CW keying via PC and CAT interface. I have tested it with Ham Radio Deluxe including the PSK31 and CW type and CW decoder XP.

Initially, I thought of purchasing the comercially available interface. But due to the cost factor, I decided to build my own and I can cutomize it to my preferences.

I found good reviews on SignaLink at
http://www.eham.net/reviews/detail/2097 , and the product's web page
at http://www.tigertronics.com/slusbmain.htm , so now I'm interested.

I'm looking for as close to Plug-And_Play as possible. Which cable did
you order for the FT-897D with your SignaLink?

Well, I just got my FT-897D and plan on doing a lot of PSK-31 and WinDRM/DVDRM and decided to try the interface from N5ZTW (http://www.n5ztw.com/FT-897.htm <http://www.n5ztw.com/FT-897.htm>).

I haven't received it yet, but looking at the circuit diagram it's exactly what I would build if I was doing it myself... It's just a lot easier to buy it already completed...

I've had excellent experience with them - highly recommended.

I bought an HT from them several months ago. Last month I ordered an FT-897D, the power supply, the AT-897 and a 4:1 balun. The FT-897D wound up being backordered, so I canceled the FT-897D, and they shipped the rest (bought the 897 from AES, same price and delivered by Field Day).

This month I have already ordered and received the FT-2800M 2M mobile, for an incredible price. They will have all my business for the forseeable future.

Phineas:
Are you talking about the FC-40 or the FC-30? Please note that the FC-40 has a much greater range than the FC-30. I would also note that the FC-40 is a more robust tuner than most of the smaller LDG tuners and as such will work better and will be less likely to fail with more extreme tuning solutions.
As for ladder line, you are correct that there is less loss with higher SWR than would be the case for coax. This permits one to tune a more severely mismatched antenna with less loss using a open-wire line than with coax. Due to this loss, unless the antenna is nearly resonant, there's not much point in running any significant length of coax between the tuner and antenna. This is not to say that the tuner will be more likely to find a tuning solution for ladder line than for coax. To the contrary, due to the loss in the coax, it's more likely to find a solution with that configuration, not that it's a more desirable solution.
The reason you're seeing situations where ladder line may be "tune-able" as opposed to coax is that in those situations your ladder line is becoming part or all of the antenna. This is particularly evident with your "door knob" example since door knobs are such a tiny fraction of a wavelength and are hardly large enough to help much as even an E-Field radiator.
One should also be aware that using ladder line with unbalanced antennas where the tuner is located at the transmitter end of the line and there's no balun at the antenna often results in the ladder line becoming part of the antenna and therefore brings stray RF closer into the shack. As such, if feeding this kind of antenna, it may be better to run coax to a tuner such as the FC-40 located at the antenna and either use a balun on the output or decouple the transmission and control lines at the input to the tuner. Since LDG is no longer providing the RT-11, they do not have a tuner designed for such service.
Again, the FC-40 would have no problem tuning up a fence, gutter, flag pole or other reasonably sized conductors. It's the FC-30 that may not, which is why I specifically pointed out the FC-40 as an alternative.

I second that...the AT-897 is GREAT. I'm about convinced it would match to a piece of wet pasta! ;) Look forward to putting it to use during the "strange antenna challenge" next year (main rule...no wire allowed except for the feedline). Just wish I had known about their price before I bought my rig @ HRO...

Did just order a new HT from Gigaparts, it was priced LOW, shipped promptly & should get here tomorrow.

Charlie

I am very aware of what a ladder line can do, and agree with you on that point
just because an antenna can tune with a tuner does not make it a great antenna.
Also, I am not a big fan of tuners that are located by the radio. Tuners work far
better as an Antenna coupler than a "feed line" match box. The RT11 is a joke. I would up
getting
better results be replacing the output PL239 with 2 butterfly posts. Then it worked great!
As far as running a ladder line to an unballanced antenna, a Zepp is an example of this,
and despite
the controversy, the Zepp antenna works. The main problem with ladder line is RF. If your
tuner is
at your radio, you will not be able to run 1kw with out tons of RF!

As far as "robustness" goes, it really depends on what you mean. Overall the FC type tuner
is "more sturdy", but that does not mean it will work better.
The FC40 we tested will only have a tuning range of 150 to 200 ohms. The LDG type tuners
will
match 750 to 1000 ohms depending on the model. Another thing about these type of tuner is
the low amount of power needed, the weight, and the fact that they will work standalone, at
the
antenna without a radio interface cable.

I did not make my comments to bash the FC40, I was just stating MY opinion based on MY
experience.
In the end, Physics wins! If you can get along without a tuner, that will ultimately be the
best solution.

Interesting. I wonder why that was. I still have my RT11 that I bought used. I used it in my truck for a bit with a 102" whip, and it did work fairly well there. Replaced that with an AH-4, which cooperated a bit better with the IC-7000. Have also used it for some portable work and it always functioned fine. Just would not put it in the same class as an AH-4, FC-40, or similar.

It's one of those "wagging the dog" kind of things. This is not entirely unique of open-wire line fed antennas and can also be a problem when feeding with coax. Ever notice how the Carolina Windom (which I like) has a large RF choke on the feed-line (they call it a "Line Isolator")? It's not that these antennas don't work. The point is, as you agree, that they do radiate from the transmission line as well -- Yuck!

> As far as "robustness" goes, it really depends on what you mean. Overall

Yes, but they aren't waterproof. Also, what I meant with my robust reference is things like component and trace size and spacing and relay contacts. This can be a real limitation due to the extreme voltages and currents the tuner may experience when "tuned". It's also why I would avoid the smaller LDG tuners for more "extreme" tuning solutions without "de-rating" them quite a bit. Also, don't take the match capability specifications as gospel. There's more to those specs than meets the eye.

It's not just the ability to arrive at a solution, but also the ability to survive that solution at rated power.

> I did not make my comments to bash the FC40, I was just stating MY
> opinion based on MY experience. In the end, Physics wins! If you can get

We can certainly agree on that. Unfortunately, it's not always possible to run resonant antennas. Which is why we have this list.

One of the best combinations is to use an Icom AH-4 with the Yaesu FT897. The Better RF interface enables this, and the combo works very nicely!

19406. Need schematic of the W4RT OBP

Yahoo group: FT897 (2007)
Date: 2007-07-10 14:04:14 UTC
From: Jochen - DG2IAQ
Topic: 19406 Message: 19406

Hello.

Does anybody has a DETAILED schematic of the W4RT OBP (One-Big-Punch) compressor and could send this to my adress

dg2iaqmods@...

please !?

The german "DYC-817" from "FUNKAMATEUR" or "BOX73" is mainly the same and yesterday evening I figured out some nice mods including a diode clipping. This made out of my DYC-817 a SUPER-DYC-817 with an "impertinent" DX-punch, ..hahaha. I use this with an electret capsule (audio-modified MH-36) on my audio-modified FT-897D at home (backup TRX, only 2m FM ragchewing at the moment).

And now I like to do the same (theoretically) to an OBP and publish those (simple) mods.

But first of all I need a schematic or very high detailed digicam pics from the top and the bottom side. Then I think I should be able to draw the schematic on my own.

Many thanks in advance.

The mods of the DYC-817 (and maybe the OBP) will be published on www.mods.dk then.

Best 73,
Jochen Heilemann (DG2IAQ)

NOT the best combination. NOt even close. I had a AH-4 with the Better RF interface. It worked fine BUT THE AH-4 works ONLY with one antenna at a time. This is fine if you only have one antenna. I do not. I have many antennas which require an antenna tuner.Also the Ah-4 is NOT meant to be used with coax fed antennas. I have a Log Periodic beam which requires a tuner. The Ah-4 is useless for a coax fed antenna like the LP.

Now I use an MFJ Intellituner which will handle many antennas. An LDG tuner would do the same thing. Now the AH-4 is gone from my shack, not versatile enough.

Not True. Please read a few antenna books before making statements like this. Ladder Line can and does handle high power every day for countless hams without ANY RF problems. Indeed it will handle high power with lower loss (no heat) better than coax.

I speak from experience, have used ladder line on countless antennas at or near legal limit. NEVER a problem.

Been doin it for 46 plus years,
Stan K9IUQ

May I ask the Original Poster what does he think seriously high
power HF stations use, RG58?

500kW stations frequently use open wire feeders, often spaced up
to 2ft or more and using fairly heavy cable

Geoff

Hi the swr warning keeps coming up, I have a Gap Challenger that is tuned, going thru a MFJ Deluxe versa tuner 11, how can I get this to go away, I disconnected the tuner from the radio and it still comes up.
I HOOKED UP A 2METER 440 ANTENNA AND GOT THE SAME SWR WARNING ON THE RADIO.
I have been on this for two days, is there a return to manafactuer set key in the radio.
Thanks Cinninnatti

IF your antenna is properly tuned/matched, you do NOT need a "Tuner"!
(The tuner is used to enable operation with a untuned/mismatched antenna)--check your cable, cable connectors, etc. Do not tamper with factory calibrations, as there is NO "Automatic reset/restore! Each radio is set individually at manufacture, and has its own, unique settings. Proper test equipment is required to re-align the radio if these settings are corrupted.--73, KC3VO-Bob Curry

Read my statement more carefully. Please. Anyone knows that you have to be careful about running ladder line
when running higher power, especially any distance into your house! This is why people generally run coax through the house, the transfer to a BALUN outside. Now, if are not running the ladder line but a short distance into your shack, fine, but I would not put a computer next to it! Been there, done that!
My statement is totally accurate. I never said ladder line would not handle high power.

Geoff

I use ladder line all of the time, obviously.
I just would not run it through my house running 1500watts to a tuner.
By the way, I am able to read specifications just nicely, and if I were to run
500kw, I am sure an RG58 would not cut it....lol

I had NO TROUBLE reading your statement. You said:

> >
> > --- In FT897@yahoogroups.com, "Phineas Henshaw" <k0kma@> wrote:
> >
> > > The main problem with ladder line is RF. If your tuner is at
> > > your radio, you will not be able to run 1kw with out tons of RF!

This simply is not true. I have my tuner right next to my window on a
desk. It sits next to my amp AND my FT-897D and my Icom Pro II. I run
high power ALL the time with ladder line - a 75 mtr loop AND a 130ft
center fed doublet. I have NO RF PROBLEMS WHATSOEVER with either my
radios or computer.

I also run AM with vintage equipment at 150 watts (600 wts pep) and NO
RF Problems.

Your statement is NOT correct as I have proved it wrong for over 47 years.

Absolutely correct. And they do it because open wire feeders can handle high power better than coax.

A properly setup station running open wire to an antenna WILL NOT cause any more RF problems than a similar coax fed antenna would.

THE REASON IS: OPEN WIRE FEEDLINE WILL NOT RADIATE IF THE ANTENNA IS PROPERLY BALANCED

Yes, you DO have to keep open feeders away from conductors. At ham power levels 6 inches or more is fine depending on the spacing of the feeders.

I missed the first part of the MSG. It sounds like someone doesn't like there FT-857D. I would guess that the person would like to sales there FT-857D? If so I would like to know your selling price.

I'm not going to tell you much I like my 857D and my 897D and you did something wrong. I would like to take advantage of you and buy your FT-857D for a low price. I wouldn't want you to feel like your trap with your radio and tell else about it to the group.

So if you want to sale your radio let me know or put it on ebay.

Note if I'm way off on this I'm sorry.

19429. Re: [FT897] Re: Any dealings with gigaparts.....FC30/40 Comment

Yahoo group: FT897 (2007)
Date: 2007-07-12 16:42:54 UTC
From: AKBiocca@comcast.net
Topic: 19373 Message: 19429

Balanced currents in open wire feeders minimizes feeder radiation. Maintaining balance in feeder current has more to do with the way the feedline is driven than any antenna symmetry. Equal currents must be forced at the driven end of the feedline with baluns and/or balanced tuners, or link coupling, etc. Once the currents are balanced they will remain balanced if coupling to nearby objects is equal for the each line of the balanced pair. Antenna symmetry helps, but by itself is insufficient to guarantee balance.

> >
> > --

Absolutely correct. And they do it because open wire feeders can handle high power better than coax.

A properly setup station running open wire to an antenna WILL NOT cause any more RF problems than a similar coax fed antenna would.

THE REASON IS: OPEN WIRE FEEDLINE WILL NOT RADIATE IF THE ANTENNA IS PROPERLY BALANCED

Yes, you DO have to keep open feeders away from conductors. At ham power levels 6 inches or more is fine depending on the spacing of the feeders.

19430. FT897D Jumpers not like the examples

Yahoo group: FT897 (2007)
Date: 2007-07-12 19:24:42 UTC
From: Jerry
Topic: 19430 Message: 19430

I opened up my new 897D to do the hardware mod and found the jumpers that are installed on my rig are nothing like the examples shown in the mods. Mine are set like this:

Back

O 1007
O 1008
O 1009
O 1004
O 1005
O 1006
X 1001
X 1002
O 1003

Front

X - jumper installed
O - open

I'd hate to mess up a good radio, so I haven't changed anything yet. Any ideas why mine is completely different? The Yaesu jumper page doesn't even show this combo.

Thanks,

Jerry K8CMI

19431. cw output

No, you will not get cw output by pressing the mike button. You need a key plugged in. To test high power output go to FM and press the button, this will give full power output.

No. No detectable output will be present unless you key the morse code keyer. Same on USB or SSB - no detectable output until you speak.

19435. Re: [FT897] cw output

Yahoo group: FT897 (2007)
Date: 2007-07-13 02:21:18 UTC
From: K6LMP
Topic: 19431 Message: 19435

It IS possible to key in CW from the mike of the FT-897. Menu Mode 26 selects "CW Paddle." It toggles between ELEKEY and MICKEY. When MICKEY is selected, the "UP" button sends a dot, and the "DOWN" button sends a dash. (or the reverse, if Menu 25 is set to reverse the dot-dash functions of the electronic keyer.)

This doesn't provide a continuous CW output for tuning an antenna tuner , but you can send CW from the microphone.

I want to thank all for their input. I received a lot of good input. The problem I started with was the ldg at-798 was not tuning. I had no power going to the tuner. That was the reason for my question. I solved the problem by reading the LDG manual and not looking at the pictures and assumeing. I had the red plug in the key jack and not the ACC jack. The end of the cable is red and the key jack is red. Thanks All Wally w1ioo

Info For Ted K4UFT
I found the connectors in a local electronics parts store. A useful reference on connectors can be found at the site http://pinouts.ru/pin_index.shtml. If you know what to call it...you can find it.
I believe it's called a 3 pin IDC - male or female.
I used the connector to adapt a cig lighter recept to allow me to use my 897D internal batteries (when not in use) for charging my HT, cell phone, gps or any other small battery powered item requiring 12v while I travel. Those batteries are really great to power up your PDA or computer (with an adapter) when waiting during a layover in an airport.

Or you can, as I do, select AM mode. It puts less signal on the air and
should therefore be easy on your finals when you are way out of resonance.

Hi Koen,

You can only charge them with the CD-24, you can still use the same supply and lead that you use for the radio but you cannot charge them through the radio power connector. IE when they are installed in the radio and the radio is connected to a power supply they do not charge, there is a separate charging connector for each battery at the rear of the radio where you plug in the CD-24, you then connect the CD-24 to the supply using the power connector used for the radio.

Hope this helps

Best regards

Indeed a FM signal on HF bands is way too wide for tuning. Am is better, better yet is put it in cw, turn off keyer, and key with paddle. This will put out a very narrow signal.Using FM MODE for tuning causes un-necessary QRM

19451. Yaesu MD-100 and Custom made DTMF pad

Yahoo group: FT897 (2007)
Date: 2007-07-13 15:54:48 UTC
From: paulcbg
Topic: 19451 Message: 19451

I just posted a photo of my custom made DTMF pad which plugs into the back of my Yaesu MD-100 Desk Microphone so now I have good audio quality and DTMF tones for IRLP and Echolnk. I found the audio quality of the Yaesu DTMF MH-59 microphone to be really poor and distorted. Anyone who had compared the MH-59 with the MD-100 knows the difference.

Construction is simple... just three wires. Here are the details:
1. The DTMF pad is made by Digitran. It is their model KL0054. I found it on eBay (sold by "RF Guys") for about $20. It has several wires but only three are used: RED, Black, and Geen.
2. I took a "standard" RJ-45 computer cable from Radio Shack and cut it at about 1 foot back from the connector. There are eight color coded wires in the computer cable: only three are used.
3. Wiring:
A. The DTMF pad RED wire connects to the WHITE/GREEN RJ-45 cabel wire for +5 VOLTS
B. The DTMF pad BLACK wire connects to the WHITE/BROWN RJ-45 cable wire for GROUND
C. The DTMD pad GREEN wire connects to the WHITE/BLUE RJ-45 cable wire for audio output.

I found a small black plastic project box from Radio Shack onto which the tone pad fits up nicely. The RJ-45 plugs into the back of the MD-100 and works in series. Depress the PTT on the desk mic and the DTMF can then be used. The tones accompany the mic's audio.

If you give this a try, make sure the wiring and the DTMF pad works as described above. Good luck!

19452. SWR Checking : FT-897D

Yahoo group: FT897 (2007)
Date: 2007-07-13 16:04:53 UTC
From: Tom
Topic: 19452 Message: 19452

Greetings,
Although I am using pre-tuned Hamsticks for my mobile operation, I would still like to check my FT-897D's SWR rating.
I have had my rig for about 2 months now and I could see nothing in the manual on how to check the SWR for this rig.
Given this rig has many Menus, I might have missed something.

Could someone please explain, in a step by step procedure, the way to check the SWR for a FT-897D?

Thanks!
Tom

From: NØMTH, Pete
Topic: 19445 Message: 19453

I use mine with a KPC 3 v5.x firmware without any problems. With the factory DIN cable wired for the 9 pin on the KPC3. And a basic terminal program on my Mac.

I use the CD | SOFTWARE command on the TNC and run my squelch very close to open most of the time.

The rig is setup to use the PKT mode, not FM. Page 37 of the manual has this info.

Menu 071 - PKT1200 is set for 50.
Menu 071 - PKT RATE is set for 1200.

No other filters are enabled.

Subject: [FT897] Connect PC/Rig Interface AND FC-30 ATU

Hi all,

just bought my 897D and FC-30 (wish I'd read the recent comments about the latter) and was wondering if it's possible to connect BOTH the FC-30 and a PC/rig interface at the same time? Since they both require connection to the CAT/Linear jack, I guess it would need some kind of dual or spliced cable - or maybe there's some kind of dual plug available?

Stan:
Of course an FM or AM signal without modulation is simply a CW carrier so there's no problem in that case. Also note that FM is not necessarily too wide for the HF bands, but since it doesn't match the footprint of other modes, additional care would be required if there is actually any modulation to avoid interfernce to other users.

Chuck - N8DNX

NO, you cannot fully charge FT-897 internal batteries from 13.8 volts UNLESS you have the YAESU charge adaptor or a similar device! The internal batteries require a HIGHER VOLTAGE than 13.8 volts for full charge-typically 16.0 volts, and a method of controlling the charge current/temperature and time is also required, or you may cause the cells to ruputre.--73, KC3VO-Bob curry

Push the F button breifly and then rotate the Mem/VFO knob until the letter i appears in the lower left corner of the screen...(MFi)...Push the A or B button until SWR appears above the B button...Switch to AM and key the radio into a dummy load to see your SWR...Then you can try it with your antenna...

From: Guy Harrell
Topic: 19459 Message: 19459

Sometime back lightning got into my FT897. When I got home from work that day she said she thought lightning had struck my antenna. When I turned on the radio I got the stink smell and it didn't work. Do you suppose it would be worth the effort and expense to send the radio to Yeasu or should I just write it off?

Thanks

Guy

Hello Guy !! Well , if you fired it up and got a bad smell , more than likely the poor '897 is really in a bad way - best to write it off and send in a claim to your homeowner's insurance ..... I would maybe like to purchase your old unit (I am very poor) for some of outside cosmetic pieces (that kind of problem occurs when you have several kids around .....) 73, Ron KA0RYT --- Guy Harrell <guyharrell@...> wrote:

Guy, Ron:
I wouldn't write the radio off too fast. In many cases lightning damage is trivial and quite repairable. If when you say "it didn't work" you mean wouldn't receive or transmit, but perhaps would come on and light up, then it could just be antenna input issues. If it just smells and doesn't light up or do anything, then it might be power input issues. If you had all kinds of things connected to it, like a remote antenna tuner with a control cable, it could easily be much more serious. In any case, it's probably worth at least taking the case off to try to locate which components have the smoke let out of them.

If you take a close look at the CD24 you fin it has 2 inputs. One is for the PA26B Yaesu AC adapter that supplies 24 volts DC. There is also a connector on the CD24 that allows you to supply 13.8 VDC (probably at abour 3 A) from any source. The output of the CD24 itself is 16.5 VDC. Hope this helps.

You homeowners insurance will cover it depending on deductable (if it's worth it) and if you have exact replacement. 4 years ago I had lightning visit and cost me every radio and computer in the house among many other things and because I had exact replacement I replaced all even those that were no longer made and got a newer comparable to the tune of $23,000 in damaged and not a blemish on my insurance. (State Farm)

I had insurance with FARMERS and they would not cover a thing even though I had a rider. They said that they couldn't find the rider and the agent was no longer with them . I finally got them to cover the Fridge but that was it. I lost over 20,000 Its with the insurance commissioner now. Their new policy says anything with an IC chip, cap or resistor is not covered. Then they doubled my insurance because of the claim. I am now with State Farm and all is covered at less than the original Farmers policy and less deductable. Farmer's is doing this a lot to people down in New Orleans. DO NOT EVER DEAL WITH THEM !! Plus they were charging extra for the rider and then lowered it after I turned in the claim. It also took 11 months and over 100 phone calls to 22 different people to even get the Fridge money. I even had a notary with a witness on the rider. Plus of course the copy with everything itemized. These people are just plain unreal. And this was after 7 years of no problems or claims. Its all with the state commission now. I also had all new UPS and good surge units that blew up. We caught them lying on tape 3 times. What a nightmare. I had to replace all the house items right away and that was over 10,000. If you have a policy with them, keep at least 20,000 set aside as they won't pay.

Get your ham insurance with the ARRL. It is cheap and they will pay
off. I had a lightning
claim on a 2 meter rig and they paid all less the $50.00 deductable.
Give them a call.
I've had two claims and they paid them fine.

I've read horror stories of the ARRL insurance - I have no insurance at all so I've got no dog in this fight.

I would suggest checking out the www.eham.net reviews of ham radio insurance and then decide.

Celito,

You can use the Mic port as a CAT port, this is one of the problems of using the FC30, it ties up the dedicated cat port. all details are in the handbook.

I use the RT Systems software, ADMS.

Works fine with both. Same cable, same software.

Celito,

You can use the Mic port as a CAT port, this is one of the problems of
using the FC30, it ties up the dedicated cat port. all details are in
the handbook.

19478. Using LDG AT-100 Pro Auto Tuner with FT-897D

Yahoo group: FT897 (2007)
Date: 2007-07-14 02:26:03 UTC
From: vk3emf
Topic: 19478 Message: 19478

Just bought a second hand AT 100 Pro and it came with an Interfarce Cable Y-ACC.
Had a look around the Web and it appears that the Y-ACC Interface Cable is used with the LDG AT-897 AutoTuner, but no mention is made of the AT 100 Pro.
Can it be used with the AT-100 Pro?
Any other tips or general information on coupling the two for best results would be greatly appreciated.
Thanks.
Carl VK3EMF

19479. Re: ft897d qrp power software mod

Yahoo group: FT897 (2007)
Date: 2007-07-13 20:17:32 UTC
From: John Randall
Topic: 19448 Message: 19479

Hi,
Its the qrp power mod, where the minimum power out can be turned down to around 1w. The mod is in the software service manual. I only wanted the 2m band power turned down below the 5w norm, sothat I could drive my 23cm transverter. So I changed the low output value only and nothing else, came out the menu by pressing the function button (F). See below text or look at the manual.
To change the value thatsa there...mine was 8, simply rotate the vfo knob anti clockwise till you get 0

Software Menu Alignment

Press and hold in the Multi Function Keys [A], [B], [C] simultaneously and turn on the transceiver while holding them in; the alignment menu will then be activated (you will hear a ☐diddle-diddle-diddle☐ opening tone sequence to confirm that the alignment menu has been activated).
In the alignment procedures, each alignment parameter is selected by rotating the MAIN dial. Each Alignment item is selected by rotating the MEM/VFO CH knob.
To store the alignment parameters when you are satisfied with the adjustment, press the [MENU] key for longer than a half second.

Select menu item ☐42: VHF-MIN.☐ Key the transmitter, and confirm that the output power is 5 W (±1 W).
In case the power is not within the specified tolerance, adjust this parameter for 5 W (±1 W) of transmission power.

Hope this helps.

From: gkar2000
Topic: 19445 Message: 19482

I was playing around with packet with my FT-857 and wasn't decoding anything. I was using Flex32 soundcard software. I saw your post and sure enough, I turned on DNF and packets decoded! I thought that was strange. I had DNR and DBF on, so I turned those off as well as DNF and the packets decoded. Why turning on the Digital Notch Filter helped the packet decoding is beyond me. Turning off the DSP functions made more sense to me.

On the 857, the DSP button doesn't actually control the DSP functions, it is just a shortcut to the DSP multifunction key menu and from there the ABC buttons toggle the DSP features.

Try the KPC3+ in packet mode with all DSP features off and see if that works.

there's a small jack on the underside of the rig, near the front,
about 1 inch to the right of centerline. The meter is well worth the
investment.

19485. LDG FT-Meters (Original Version)

Yahoo group: FT897 (2007)
Date: 2007-07-15 03:41:36 UTC
From: w4wb
Topic: 19485 Message: 19485

Much to our surprise, we found another box containing a number of the original version of the LDG FT-Meter for the FT-897 and FT-857. This is the one that has the amber faceplate and no off/on switch. Good news is that they are just $29.99! We can assure you that when these are gone, that will be the end of them. Sure glad we found them since a fellow talked me out of our last one at Dayton ... it was the one we use for the demo with our FT-897 & 857. Now I'll have one myself!

For more info, see http://www.w4wb.com/LDG/FT-Meter.htm .

Topic: 19487 Message: 19487

I finally was able to order a FT 897. So far I am very impressed.
I am getting area repeaters programed but still have to go back over the directions for each step.No big deal. Some have had questions about dealers. I ordered my radio Wednesday afternoon. At about 4:50 PM
I got a call from Gary at AES. Problem with my cash card. Over the dayly limit. I call the bank,get that took care of and call Gary at AES back at about 5:15,everything is ok now. THURSDAY afternoon the radio is delivered by UPS.Less than 20 hours after my phone call with AES,the thing is here. Man that is what I call service.I'll sure remember that next time I order something.73 have fun

19490. RE: [FT897] Using LDG AT-100 Pro Auto Tuner with FT-897D

Yahoo group: FT897 (2007)
Date: 2007-07-15 15:33:30 UTC
From: Ken Bandy
Topic: 19478 Message: 19490

Hello Carl. Yes, the Y-ACC cable is used with the AT 100 Pro, as well as the AT-897. Take a look at pages 6 and 7 of the manual, it details the connection there. If you didn't get a hard copy of the manual with your unit, you can point your browser to http://www.ldgelectronics.com/manuals/AT-100ProManual.pdf. With that cable connected, you can press the "tune" button on the tuner, and the radio will go into CW mode (as I remember) and the tuner will find a good tune. I usually manually drop the power on the 897 to around 10 to 20 watts, to protect the finals. I know there is a protection circuit, but I still do it.

73, and enjoy your new tuner!

19491. Re: problems with new HF antenna

Yahoo group: FT897 (2007)
Date: 2007-07-15 23:15:25 UTC
From: k6daf
Topic: 19491 Message: 19491

I am a new Ham and just go my General and I am setting up my HF base station. I have the FT-897 with the LDG meter going to a GAP vertical antenna 8 bands using a 100 ft run of RG-8x coax.

Issue: when I first turned on the unit I was receiving on all bands. But when I went to transmit I get nothing, meter does not move no pwr out. I have a seperate 6 meter antenna and hooked that up to HF connector and was putting out 100 watts meter works fine. Reconnected the GAP antenna and nothing. To isolate the antenna I unconnected the coax at the antenna and got the same result. I checked the connectors and they seem fine. I used a meter and went from the pin to the barrel and no meter movement. I put the two meter probes on the center pin and got connectivity. How can I check the coax run to make sure their are no breaks or is their a setting on the FT 897 that I have failed to activate?

Any help would be great just hopeing I don't have to take the antenna down from the top of the house.

There are several different tone settings. If you radio says TSQ you won't hear the repeater unless it sends out a tone. This happens from time to time.

Hello Doug

Pressing the PTT while on SSB produces.....nothing...unless you provide
audio to the mic. (modulate)

Choose a free SSB frequency, tuneup, press the PTT and whistle into the mic.
You may then find what you are looking for.

Thank you very much that was the problem. All seems to be fine now.

Its nice to have somewhere to go to find these answers. I would have probably torn the antenna down next.

Thanks,I have that repeater working correctly now. Still not sure how I had it wrong.[dumb attack I guess].
My intent was to set the CTCSS code to access the repeaters when I transmit.I don't know how I would set a code for receive. I have not found a menu for that so I can turn it off.
Also there is some kind of little icon above the the thing that says USB or LSB.I can't see what that is a picture of or what it is.[@#@%^&*@# trifocals]any help.

When you press the tone button, you will cycle thru several option - ten (tone encode), tsq (tone encode, de-code), dcs (digital coded squelch), etc, and for no tone at all, the "display" will be blank, so to speak.

Setting the "ten" will send a tone when you transmit ONLY. If you select "tsq", you will send a tone when you transmit and will allow you to "hear" a repeater if it is set up to also transmit a tone. This is also referred to as "CTCSS". So remember that - I am not sure if it is stated this way in the manual.

So remember that - I am not sure if it is stated this way in the manual. <<

Well, that's not how I understand the TSQ setting!!

Yes, if you set "TEN", you will transmit the specified CTCSS tone when you transmit. If the repeater requires the tone, you will of course not open the repeater unless you have "TEN" turned on AND have the proper CTCSS frequency set (at menu 83).

But "TSQ" means both that your transmitter is sending the CTCSS tone when you transmit and that your receiver is REQUIRING that CTCSS tone in order to open squelch so you can hear traffic on the frequency. This is fine if the repeater in question "passes through" the CTCSS tone, meaning that it transmits the same tone that it requires for receive. But if it does not, your receiver will not hear transmissions from the repeater. In my area, many repeaters pass CTCSS tones through and many do not.

In other words, setting TSQ does not "allow you to hear" more than you would have heard otherwise. Rather, it excludes transmissions on that frequency unless the CTCSS tone is also received, so you may hear less.

The trouble with the TSQ setting is that it can prevent you from hearing some legitimate traffic on your frequency, leading you to cause unintentional interference with that traffic when you transmit.

On the other hand, you may be within range of two repeaters that use the same output frequency but different CTCSS tones. I can hear two such pairs (and all four repeaters are coordinated!). I have to use the TSQ setting with such repeaters in order to avoid hearing two repeaters at once.

Setting up the '897D to operate on a 10m FM repeater is exactly the same as working a 2m or 440 repeater. In a nutshell:

1. Dial in the repeater output frequency (e.g. 29.640) and select FM mode
2. Set the offset (menu D - select '-' as all 10m repeaters should be a minus shift)
3. Set the tone if needed (menu E - select 'TON' and then set the required tone)

The one exception might be if the repeater has an odd offset. That would be highly unusual, though. Otherwise that's it. Once you have the above set you're ready to operate.

If I'm not mistaken, don't you have to set the deviation to 2.5KHz (instead of 5.0) to legally use FM on the 10 meter band?

Michael,

Yes - HF always goes out the same connector regardless of mode.

The VHF/UHF connector is only for 146 & 440.

FMN is the 2.5KHz deviation mode that you'll need to use. I believe the manual talks about it in relation to the 10 meter band.

From: lanoitanbell
Topic: 19521 Message: 19521

Hi

Have a FC30 tuner connected in rear acc connector operates
well.

Have a mike adapter/splitter cable for mike jack CAT control
it worked OK for las 2 years. This morning...no go.

I made FT-897 cold reset...revised all menus...checked the cables
continuity....no luck.

When at menu 59 selected to normal the mike fast/slow scan and scan
function operates that mean that the radio micke jack sérial interface
is OK.

I'm lost in the woods any toughs

Thanks in advance

From: kc3vo@aol.com
Topic: 19523 Message: 19523

Perhaps the WRONG sideband has been selected for 20 meters! Some bands normally use UPPER SIDEBAND (USB), and other bands normally use LOWER SIDEBAND (LSB)---The rule is this: Frequencies LESS than 10.0 Mhz are normally LOWER SIDEBAND, and frequencies above 10.0 Mhz are UPPER SIDEBAND, so use USB for 20 meters, but use LSB for 40 meters, and tune SLOWLY for natural voice sound. LSB=160, 80, and 40 meters, all higher frequencies, 20, 17, 15, 12, 10, 6, 2 meters and 70 cm as well as microwave is normally USB.---73, KC3VO-Bob Curry

Hi Serge,

Following your reset is your radio communicating at the same baud rate
as the PC ? (Menu 019)

Hope you get it sorted

Regards

Andrew - G7MNS

19525. ft-897 d and mfj-993B

Hi all
Does anyone know what difference using the data link cable to the MFJ-993B intellituner does.. I have a tuner and it runs fine and does exactly what it says on the tin but am I missing something by not having the link cable.

Any help will be most appreciated.

cheers

Ian

Hi Ian,

I have the same tuner, by having the data cable into the CAT port in the FT-897, the tuner will be powered by the radio, thus, it will turn on at the same time you power up, also, the tune button on the FT-897 when pressed will drop the power to 10W and send an AM carrier to the tuner.. A somewhat spendy cable but it works very well.

My radio I was told by the Yaesu tech, was that the front end has gone out, how I never used HF and 2 meter 440, only once in a rare time.
I mostly listen as of HOA.
How could this be, 2 meter and 440 send but no recieve.
How could this happen.

If your antennas were within about 20 feet of each other, and you operated the radios, it IS likely that you would damage the front-end of the receiving radio! Separate those antennas by at least 50 feet, more separation if using high power-over 50 watts-if one antenna can be placed at least 10 feet HIGHER than the other, this will also help, when using vertically polarized 2m/440 antennas. Damage can occur to EITHER radio, whichever radio is receiving at the time is likely to suffer damage.-73, KC3VO-Bob Curry

Hello Cinninnatti,
The FT897 has seperate Rx RF amplifiers for 2m and 70cms
so, if by front end you mean the RF amps, it doesn't look
likely that a dud front end is causing your problem.
Can you hear another Tx operating close by? If the RF amp's
were dud you would still be able to hear strong signals.

Before you send it off, make sure you have the SQL/RF Gain menu item (number 80) set to SQL.

This may solve your problem

Hi Serge,

Does the CAT port on the rear of the radio work correctly when connected to the computer ? I know the tuner is connected at the moment but try disconnecting the tuner and connecting the computer.

Regards

Andrew - G7MNS

Yep that's the first test I done and it works perfectly
The mike buttons operates OK Fast/slow scan and up/down functions
are ok at menu 50 NORM position but no computer control at CAT
position.

Thanks for the suggestion Andrew

It would not in my opinion but weirder things have happened...I'm in Montana and as a thunderstorm approaches in this dry climate my coax can become charged...I unhook everything everyday between May and Oct...When I lived in Ohio I did not because the air is more humid and it wasn't a problem but I did whack the receive on an HF rig with poor grounding with another radio one time...

Further to my last mail, The mixer stage is
common to HF / 2 and 70 so if your HF Rx
is OK it can't be the mixer either. The local
osc' could be at fault, or the front end filters
and their switching. You really need to get
the covers off and make some checks.

From: Buddy
Topic: 19547 Message: 19547

Hi All,
My FT-897(bought in 2004) suddenly will NOT stay on. When I press the power button the radio powers up for 3-5 seconds and then shuts off.

If I am using the power supply I have to shut off the switch on the back of the power supply to reset the FT-897 before the power button will even operate again, then when I press the power button the same same problem persists. The power supply is good. (Putting out 13.9v according to my meter)I have used it to power my FT-857D with no problem.

When I use the batteries I must reset the battery switch from A to B and back before the power button will even operate again, then when I press the power button the same problem persists.

Any Suggestions on the problem ?? I have sent the radio to Ham Repairs.com in Carrolton TX

Yes: you must turn your extended menu on at menu item 1.

From: Victor P
Topic: 19527 Message: 19550

Hello I have a question, I want to know what I'm doing wrong when I charge the battery for my 897. I plug the charger connector to the right and the red light shows up then I wait till the light going off but without TX the battery doesn't go longer than half an hour and the battery dies. What can be the problem? Also what is the white plug with the six holes...the connector from the CD24?

From: Mike Bryce
Topic: 19437 Message: 19551

What exactly does the CD-24 do?

Is it a simple switching dc to dc supply to up the standard 13 volts
to something higher for the batteries?

I use the w4rt thingiee and it's based on a off the shelf battery
charger chip.

but I also need the wall wart supply to operate the w4rt charger.

will then the CD-24 be needed to say charge the 897 internal
batteries from the car battery in field?

Hello Carl. Yes, the Y-ACC cable is used with the AT 100 Pro, as well as the AT-897. Take a look at pages 6 and 7 of the manual, it details the connection there. If you didn't get a hard copy of the manual with your unit, you can point your browser to http://www.ldgelectronics.com/manuals/AT-100ProManual.pdf. With that cable connected, you can press the "tune" button on the tuner, and the radio will go into CW mode (as I remember) and the tuner will find a good tune. I usually manually drop the power on the 897 to around 10 to 20 watts, to protect the finals. I know there is a protection circuit, but I still do it.

73, and enjoy your new tuner!

Ken

Subject: [FT897] Using LDG AT-100 Pro Auto Tuner with FT-897D

Just bought a second hand AT 100 Pro and it came with an Interfarce Cable Y-ACC.
Had a look around the Web and it appears that the Y-ACC Interface Cable is used with the LDG AT-897 AutoTuner, but no mention is made of the AT 100 Pro.
Can it be used with the AT-100 Pro?
Any other tips or general information on coupling the two for best results would be greatly appreciated.
Thanks.

The CD-24 charge adaptor is a DC-DC coverter that steps up voltages in the 10 to 16 volt range, and steps down voltages in the 18-30 volt range, to charge the internal FT-897 batteries. The unit ALSO controls the charge TEMPERATURE, CURRENT, and TIME to protect the batteries and radio during charge. (Overcharge can result in cells venting/exploding, with possible release of electrolyte into the radio circuitry-do not charge internal batteries without a charge controller! (Approximately 16.5 volts is required to FULLY charge the internal batteries, EXACT voltage needed varies with cell temperature.)-73, KC3VO-Bob Curry

Do NOT cut your FT-897 circuit board!! The boards used are multi-layer, and have circuit traces INSIDE the boards as well as top and bottom, so cutting the board may lead to radio destruction! If you are not skilled and equipped for proper repair, seek qualified assistance, or ship the radio to a YAESU service agent.

Gene,

I haven□t followed this thread from inception so maybe my input may not be up to date, but to clarify, the FT-897 does have a tune facility when used in conjunction with the ATAS 120, FC-30 and FC-40.

Press the menu function button and rotate the mem/vfo knob till TUNE is displayed above the A button in the display window . You then have a TUNE button on the FT-897

19560. Re: [FT897] Re: Driver FETs

Yahoo group: FT897 (2007)
Date: 2007-07-20 14:43:17 UTC
From: K.Greenough
Topic: 19259 Message: 19560

Hello Peter,
Yes I managed to replace the driver FETs, but it's
not a job I'd be too happy to do again. Did you
change yours with the board still mounted in the
set? If you had the board out you were lucky that
the heatsink block didn't come away from the board,
it's only soldered. I did mine by putting a couple
of bolts / nuts through the PCB and heatsink and
nipping them up so that the heatsink couldn't come
off. Then I held a 65 watt Henley Solon Iron to the heat
sink [it's got a massive copper bit, lots of heat reserve]
until I saw the solder melt and lifted off the fets with
small pliers. Putting the new FETs on was the worst job,
I had three attempts before it worked, the slightest
misalignment and you get a short across the contacts underneath.
When I got them right I was sure they were cooked but
they set up [standing current] OK and the set worked.
If ever I get this problem again it's off to Yaesu, hi.
They use hot air equipment.

Hello Bob,
Thanks for the warning, in the end I didn't have
to resort to that [when I made that comment I
thought that the FETs were integral with the heatsink
and could not see how they could be replaced].
Are you sure about the multilayer boards though?
I have the service manual with board layout and
track patterns and it only looks to be double sided.

The battery is probably bad.
You can try to charge it with another battery charger and see how long it lasts. Mine gives me at least 4 hours receive time.

You can use the 12V power cable, that came with your 897, and connect it to the white plug at CD24 instead of the AC adapter. Charging takes longer with 12V.

With 12 volt it will not even charge at all, regardless of the time used. The batteries use 11 cells, at cutout they still have 13.2 volts. You need a charger which can deliver 15 to16.5 volts to reach full charge.

True, but only if not using the CD24 charge adaptor! With the adaptor, the 12 volts is stepped up to approx. 16.5 volts, which WILL fully charge the FT-897 battery. -73, KC3VO

I have just checked my PA26. As Victor says, 100 - 240 V AC 50 - 60 Hz.

I notice that Ted refers to a PA24. Confusion here I suspect between the CD24 and the PA26. Sorry if this seems pedantic, but a few characters do make a difference as to which device is referred to.

19572. restoring batteries

Yahoo group: FT897 (2007)
Date: 2007-07-21 08:50:01 UTC
From: John Randall
Topic: 19572 Message: 19572

My laptop batteries would only last 1 hour, until I placed it in the deep freezer for 24hrs. I then connected a 12v light bulb across the output terminals to drain it completely and then recharged it.
I now get 4+ hrs use out of a charge.

This also works with nicad batteries.

No problem Gene,

Real amateurs only read the manual when they start understanding how a rig functions. Reading it ahead of time does help to a certain degree but the search for more knowledge, via the manual, only comes later .well, that□s how it is with me anyway.

Anyway you□re right, the manual requires as much of an understanding as does the rig. The info is well hidden and one needs to really dig deep when searching for something, and once found, the info is usually very sparse.

73, Johnny.

Dexter, I too am somewhat new to SSB, however I have been working Army MARS for about 3 years now on SSB nets. In that venue we have our frequencies listed as centers of intelligence, but our "window" frequency that we set in the radio is either plus 1.5 kc for LSB or minus 1.5 kc for USB. Now if I understand what I think I know about 15 thru 18 these are preset offsets that would allow me to tune to the center of intelligence and the radio would choose the correct offset depend on the mode selected. Right now I have all of these set to 0 and just tune to where I need to be Amateur or MARS.

From: Johnny Burroughs
Topic: 19513 Message: 19578

Hello Adrian,

The FT Meter works with the supplied mono lead.

Make sure Menu Option 61 (MTR ATX SEL) is not set to OFF but set to the option that you wish to use (PWR,SWR,ALC etc). If this is set correctly, confirm that you are plugging it into the female jack in the front, bottom of the rig (underneath) , more or less between the VFO and the AF-SQL/RF knobs.

73, Johnny.

From: wb8oif
Topic: 19582 Message: 19582

OK, this may be in the manual, but I don't see it, so don't flame me :)
After a signal reaches S9 my LCD says S+. there are only 2 marks at
the bottom of the graph past what I am interpretting as S9. What value
to those marks represent? 10dB over 9, 20dB over 9??
Thanks es 73

They represent S9 plus & S9 plus plus..

but seriously the S meter on the 897 is very nonlinear and very
arbitary.

Here are some results om 80m I took recently:

The Results show why meter readings should not be relied upon, and
explains sudden drops in indicated values.

The steps between readings are as follows:

S1 -2 1dB
S2-3 1dB
S3-4 0.5dB
S4-5 1dB
S5-6 2dB
S6-7 6dB
S7-8 8dB
S8-9 7dB
s9 -+10 16dB
+10-+20 20dB

I don't know for sure, but on my LDG FT meter when it gets to S+ my meter tells me if it is 10, 20, 40 or 60 over S9. I quit paying attention to the bar meter since I started using the FT Meter.

Hello Dexter,
Menus 15 to 18 adjust the carrier insertion frequency
15 for Lower Side Band receive
16 for LSB Transmit
17 for upper side band receive
18 for USB transmit.
If you adjust the receive setting it will give a different
audio "pitch" to the signal, you may prefer more top
or bass. It can also compensate for filters that do not
exactly fit specifications.
The transmit settings do the same but to the transmitted signal,
you can adjust on air for best reports, or, you can do as I have
and leave them all at zero.

With apologies, yes, it is the CD24 that provides the 12 VDC charging input. Thanks Peter. I have used the PA26 from both 115 and 230 VAC to supply the CD24 and at home I generally use the 13.8 from my station power supply. I really have noticed no real difference in charging times as some seem to have.

19587. Main dial fault.

Yahoo group: FT897 (2007)
Date: 2007-07-22 21:42:37 UTC
From: Donald MacLean
Topic: 19587 Message: 19587

My FT897D is unused but has been in the attic for a couple of years. I find it works well (with an FC40 and longwire) but the main dial seems fuzzy ... imprecise ... sometimes it will turn almost half a rev with no effect ... as though an optical coupling has acquired a cobweb! This applies both when tuning and when selecting a menu item. Any advice, please?

Donald.

Donald, that sounds similar to a problem I had with my unit a few months after I bought it. With mine, I noticed a couple of "dead" spots that progressively got larger, until more of the control was dead than not. Does your problem carry over to other uses of the knob, such as selecting menu items, etc.? Mine did.

My unit was still under warranty, so I sent it back in. It was diagnosed to be a faulty optical converter. I was without it for about a month, but haven't had any problems with it since, and this was about 2 years ago.

Good luck with it.

73,
Ken

Subject: [FT897] Main dial fault.

My FT897D is unused but has been in the attic for a couple of years. I find it works well (with an FC40 and longwire) but the main dial seems fuzzy ... imprecise ... sometimes it will turn almost half a rev with no effect ... as though an optical coupling has acquired a cobweb! This applies both when tuning and when selecting a menu item. Any advice, please?

Donald.

Hooking up the cable will allow the tuner to cause the transmitter to emit a low-power carrier for the tuner to tune with. I never bothered (partly because I use the cable for my computer and HRD). I just turned the AM modulation to zero and put the radio in AM mode and key the mic when I want to tune. Even with the power dialled down to 25w on HF, that will produce about 6w which is plenty for the 993B. It's a great little tuner!

Check your mode setting. You may be in one of the CW or digital
modes. The 897 remembers the mode setting for each band.

If I'm not mistaken, it's the other way to. The tune button on
the 993 will then cause the 897 to emit a carrier for tuning.

Hello group I do have an other question. if I am operating the radio with the external power supply conecting directly to the radio is the battery on standby/idle or is it on a separate circuit and has nothing to do with the battery? Also, I believe you can put two batteries in the radio (since there are switches A & B). Can I put an internal power supply sharing with one battery? 73s

Donald,

had the same problem with mine, probably a transport damage.
I sent an email to Yaesu for a quote for the spare part, no answer.

After some investigation I found the original supplier is COPAL,
Japan. http://www.copal-electronics.com

Here is the data sheet of the Rotary Encoder:
http://info.tactnet.co.jp/cgi-bin/copal/erodisp.cgi?pg=0&pk=pdf&pf=040REE&pm=REE002&pn=9
The part number is: RES 20D-50-201-1

I ordered 5 of them for me and other FT-897-owners from a german
distributor ECOMAL, paid abt 18 Euro each.

Has anyone used his radio for fm sat. operation? The appendix of the owners' manual describes the procedure. However, the current fm sats. require an uplink pl tone and the procedure in the manual was written before pl tones were required. I have attempted to progam the 2M uplink frequencies with the pl tone but when I look at the display when I press the ptt button, I expect to see the "ten" but its not there. Has anyone had any luck with this?

Many thanks, Ken and Jurgen - I read your experiences with interest.

I've sent the rig to an independent repair facility here in the UK - the engineer told me that he has met this 'optical converter' problem with the FT897D a few times, but not frequently.

So ... a couple of weeks QRT for me. (xyl says "Good - now you can do your Tax Return". Yeuch!)

I've programmed my 897 for this and verify operation
(including test of PL tones), and it works.

Key thing is to realize that you set all parameters
(including transmit parametters) on the *receive* frequency,
and only overrule the transmit *frequency*, nothing else.

So, for the first channel of the main transponder of AO51:
1. Program receiver for 435.310 MHz, TEN, tone=67.0
2. Program in memory the usual way
3. Set VFO to 145.917 MHz. No need to set TEN or tone
4. Press MW, press PTT and keep pressed, press MW, fill in tag if needed.

You'll note that TEN is on the display, receive on 70cm and transmit
on 2m, with proper 67 Hz PL tone.

5. Repeat for other channels, adjusting frequencies to allow for
doppler shift.
I usually find it easier to program all receive frequencies
in one run, then program all transmit frequencies in the other run.

BUT: the 897 isn'y the most suitable to work the bird.
When I work AO51, I try using an 817, 1 Watts output and a portable
(arrow) antenna. Plenty of power.
The FT897 can't be set lower than 5 Watts on 2m.
Unless your antenna is really poor (in which case your reception
suffers too), you are very likely to use way too much power
for the bird. It's OK for a casual test but I'd really recommend
considering a different setup if you want to do this frequently.
I don't know what AO51 is like in the USA but here in Europe
there's a whole bunch of (mostly, south-European) "crocodiles"
(= big mouth, small ears) and the northern half of each pass
is usually more usable here, unfortunately.

AO51 with an arrow antenna and an 817 or small VX handheld
is lots of fun and 1W is really plenty. Do try it!
(I also get lots of questions from street kids, even *weeks*
after a test run, it's an excellent way to stir up questions!)

I don't know which supply you are using and you may have already mentioned that on another mailing but it is a possibility that you may have lost one of several of your pass transistors. I have seen this when the transistor blew open - Just a thought. I would sure park it until I had the problem resolved - otherwise they tend to have a tendency to grow into larger problems.

Did you store the memories with the tone on? If you don't, the
tone will be switched off every time you recall one. The TEN
should be lit all the time when you have a tone selected.

19608. Key Troubles

Yahoo group: FT897 (2007)
Date: 2007-07-24 11:54:40 UTC
From: John Blake
Topic: 19608 Message: 19608

Hi, I have just joined and have also just bought an 897D.
Got a LDG Z11pro tuner today and ran it with my end fed wire with a 4:1 balun. Tuned up great, had a cw contact on 40m all was well.
Then some time later I heard an arcing noise coming from the back of the rig, then it did a sort of shutdown, lost all presets then came back up again.
All memories were cleared, no probs, but I cant get the key to work again, all elese works ok.
The only other problem was that I got it second hand (just) and somethings were set up already. One of those being 70cm rpt with a 123hz decode. When I try to set the decode again I can't seem to select 123hz it gives me 122 or 125 (strange).
I tried all settings with the key, but no luck.
Could it be possible that some RF got into the key lead and fed back into the jack?
I was running 50 watts at the time and rg213 out of the shack into the balun and the the end fed wire.

Cheers

John VK6JRB

The power supply is either faulty or not man enough for the job.
You will require at least a 20A power supply for 100W.

If you are using SSB, at maximum output, the power supply ammeter
will probably display a maximum current of perhaps 10A. However
the peak current will be more like 20A or higher and this peak
current is probably causing the supply problems.

19611. USB version of Nenad Rotter's Microphone Port for FT-897

Yahoo group: FT897 (2007)
Date: 2007-07-26 12:27:56 UTC
From: Lewis Phelps
Topic: 19611 Message: 19611

Many on this list have read the article in the April 2007 QST Magazine by Nenad Rotter, 9A5AN, describing a mic interface that plugs into the mike jack of the Ft-897 and provides a second CAT port, a jack for a PTT, foot switch, and the ability to plug in third party microphones with conventional 3.5mm plugs. Nenad's project provided data I/O through a 9-pin RS-232 serial port.

Inspired by Nenad's design, I have built a similar project, with the following differences:
1. Output through USB interface (which was my main goal in the redesign, since my laptop has only USB ports).
2. Enclosed in small metal project box rather than an open circuit board.
3. Accepts 1/4" mike jacks as well as 3.5mm jacks.
4. Does not require etching of a circuit board.
5. Reduces component count by 8 capacitors.

The entire project fits in a readily available aluminum project box that measures 4.25" x 2.25" x 1.25", which is small enough to fit under the rig, like Nenad's original design, and not block the jack for the external meter.

I'm in the midst of writing it up for QST. Let me know if you're interested and I will send you a draft.

Thanks again to Nenad for coming up with the idea in the first place.

Hello Lew, I also am VERY interested on your work, hoping to receive or at least be entitled to see just before all will be sent to QST and disappear at once to those, like me, are not magazine subscribers !.
Thank you very much for any interest on my request.

19620. Re: [FT897] USB version of Nenad Rotter's Microphone Port for FT-897

Yahoo group: FT897 (2007)
Date: 2007-07-26 18:29:00 UTC
From: Lew Phelps K6LMP
Topic: 19611 Message: 19620

Wow. In the space of an hour, I got a dozen requests for copies of this project description. Rather than email to each person individually, I decided to post it in a pair of downloadable files on a personal web site. If you are interested, you can get the project description, and a separate schematic diagram, at the following links:

http://www.phelpsclan.com/files/usb_project.pdf
http://www.phelpsclan.com/files/usb_schematic.pdf

I would very much appreciate feedback on this document. it is a DRAFT, and in particular if there's anything unclear, or anything that people with more knowledge of circuit design than I have see as stupid or ill-conceived, I'd sure like to hear about it. What I do know is that the project works, and to the best of my knowledge doesn't have any problems of RF getting into the audio system.

A couple of caveats:

1. read the original article, paying special attention to construction of the cable, and to the various settings on menu items on the FT-897, including the software bug that sometimes requires resetting the mike to "normal" and then back to "CAT".

2. I am not an electrical engineer, or anything close to it. I don't think this project will either damage itself or the rig, but if you build it and use it, you do so at your own risk.

3. Total cost for components will be about $50.

Thank you so much for the detailed explanation Geert. I will follow your instructions as you described. I'm using the FT-897 because my Icom IC-T81A ht needs repair. I'm on Catalina Is. off southern california which is a great place for sat. operation. However, I left my diplexer at home because I thought I would not be able to resolve this problem. :(

Indeed, and the manual says the radio peaks at 22A when transmitting.
Running close (or, indeed, over) the PSU limit is asking for trouble.
That it "worked before" is proof of nothing - components age, and minor
adjustments to things like mic gain are inadvertently made.

Hi,
Sounds like your power supply is not heavy enough. What is the
current rating? It should be at least a 13.8 vdc 25 amp power supply
to run full output.
Also, make sure you have a good RF ground. As short as possible
run of number 6 ga. copper wire from the transceiver to a 6 or 8 foot
ground rod.

Just some thoughts ..... 73' Jim

19624. Re: [FT897] USB version of Nenad Rotter's Microphone Port for FT-897

Across the pond, Geoff Blake detected a drafting error in the schematic diagram I posted for the USB Mike Port project. (I had shown both pins of the two mike jacks shorted to each other, which obviously would cut down your modulation level VERY considerably.) I have corrected that, and posted a new schematic with a slightly different filename. To get the corrected schematic, you will need to use the following link:

http://www.phelpsclan.com/files/usb_schematic2.pdf

The project description, which includes sources for the uncommon components, remains posted at:

http://www.phelpsclan.com/files/usb_project.pdf

I have deleted the erroneous schematic from the server.

Thanks for all the encouraging response to this project. I look forward to feedback from anyone who builds it.

Or it could be that your SWR is super high and the radio is cutting back the power to save the finals.

The power supply is either faulty or not man enough for the job.

You will require at least a 20A power supply for 100W.

If you are using SSB, at maximum output, the power supply ammeter

will probably display a maximum current of perhaps 10A. However

the peak current will be more like 20A or higher and this peak

current is probably causing the supply problems.

Quick update:

I got my N5ZTW interface in and it's working gangbusters! Great RX/TX audio and works great with my laptop.

It's got that "homebrew" feel that I like, however it was assembled very well and should last quite a while.

Just received my General and I just installed an 8 band GAP vertical antenna. Using the FT-897 radio.

I am trying to check the SWR and have a Diamond SX-600 meter. When I am checking the different bands do I have the mode set to FM or do I put the mode on USB or LSB? When it is set to USB or LSB the needle only moves when I say something and I can not get a reading.

I know this is probably a basic question but I have looked in all the manuals and searched the internet and have found no help.

Thanks

Doug

Congrats on the upgrade, Doug! SSB does not transmit a carrier, so there is no power put out unless there is modulation. Use AM mode to get a carrier to tune with.

Hi Doug, SSB will emmit an rf signal when it senses microphone input,
voice. FM, AM will be constant output.

19632. CW vs CWR?

Yahoo group: FT897 (2007)
Date: 2007-07-29 08:17:07 UTC
From: ringmodulator99
Topic: 19632 Message: 19632

Hi list,

technically, I understand, that the difference between CW and CWR mode is, that in one mode the BFO frequency is above and on the other below the receiving frequency (IF) to generate the audio signal.

My other trx only have one mode for CW.

So I wonder, in which situations it would be desireable to switch from CW to CWR or vice versa.

Any hints are welcome.

73, Chris

Hi Ron. I did a Google Search for "ft897 quick reference", and got lots of hits. Looks like there are at least 2 or 3 different sources for what you are looking for.

When you are suffering an interfering signal, the switch to the
other sideband (for that is effectively what it does) may reduce
the effect of the interfering signal.

Hey Ron,
I picked up a laminated 11"x14" quick reference card that is dual sided. I got it on eBay for about $12 shipped. I would highly recommend one to anyone. Very useful. Hope this helps!

Thanks,
KD8CCX - Adam Filkins

What I do is set the radio to AM and set the AM mic gain to zero. Since I almost never USE AM that gives me a carrier at about 25% peak power to use for measuring SWR. For me it's quick because my tuner (MFJ-993B) has a digitally-displayed built in meter, as well as a dual-needle analog meter. Even with the max power set at 25w (which I do to hold down RFI problems) the AM carrier is enough for my tuner to read.

Trying to set SWR on SSB is useless because there is nothing coming out unless you're talking (as you've noticed). Another way is to put a key in the jack and emit a CW carrier. The danger there is that you may be pushing full power into an unmatched load. Same with FM. That's why I use AM. It reduces the carrier output and with no modulation, the power is at a much safer level.

CWR is quite useful when you want to listen to an SSB net and
check in on CW and it's on LSB (as most 75m nets are).

What's an interfering signal? I never hear any. I put the 60hz DSP on for my local CW net and I have to chase even some of the net stations. Of course anyone zero beat with the NCS is fine....

Subject: [FT897] Re: setting up new base station

Just received my General and I just installed an 8 band GAP vertical antenna. Using the FT-897 radio.

I am trying to check the SWR and have a Diamond SX-600 meter. When I am checking the different bands do I have the mode set to FM or do I put the mode on USB or LSB? When it is set to USB or LSB the needle only moves when I say something and I can not get a reading.

I know this is probably a basic question but I have looked in all the manuals and searched the internet and have found no help.

Thanks

19653. Transmit switches to fast tune

Yahoo group: FT897 (2007)
Date: 2007-07-29 21:29:43 UTC
From: Rob Thomson
Topic: 19653 Message: 19653

I have searched the archive but have not seen this one.....

Sometimes, after transmit, the rig switches to fast tune mode (running man). This is not a function of high SWR.

Any ideas?

From: wa4abr
Topic: 19654 Message: 19654

This group has been recommended to me by several OPS and I signed up! I have not operated the low bands for many years and am looking for an economically priced, simple to use, "all-band" (HF/VHF/UHF) rig. My limited operating time will be phone only divided between base station and mobile. Initially, I think most of my operating will be during lunch from my vehicle.

Compared to similar rigs, the FT897D seems to be a good rig for me. I would appreciate any info and advice the group may provide.

Thanks for your help. 73

Ron,

HRO and many other places carry the "Nifty" quick refernce guide. I
have one for both my 897 and 857. Very handy.

Hi Geoff,

thanks for your quick reply.

I use the 300 Hz Yaesu CW filter.
Assuming that the desired station is in the center of te passband and
the QRM is slightly above (or below), but within the passband.
I would expect that switching from CW to CWR the QRM would still
remain within the passband of the IF filter.
From my understanding, the QRM would just change its audio frequency
from higher to lower pitch or vice versa.

The FT-897 is a poor mobile rig unless you have the space for it. The face plate isn't removable and it's very large. The FT-897 is best for portable operation, I would recommend you looking into the FT-857 or the Icom mobile radio ic-2000 I think.

Ken, I personally think that the FT-897D is best suited for base or portable operation as opposed to mobile. Although Yaesu sells a mobile mounting bracket for the '897 the rig's a bit large to mount in most modern vehicles. If you plan to run mobile I would recommend the FT-857D. It's basically the same radio as the '897 but in a smaller package. It also comes with a separation kit which would make a mobile installation a bit easier. Of course the '857 doesn't have the option for internal batteries but if you don't plan to operate portable then the lack of that feature isn't an issue.

The middle button on the stock mic toggles Fast mode on and off. Perhaps RF is getting into the mic and/or mic cable and causing the rig to behave this way. Just a thought. RF in the shack can do some really bizzarre things. My rig was shutting itself off and then immediately back on if I transmitted below about 3.8 MHz. (The radio body is remote mounted so I have a long control cable.) I fixed it by putting ferrites on the control cable near the radio body. I just kept adding them until the problem went away. I used up every ferrite bead and toroid I could lay my hands on without having to cut a cable to get it.

I gently differ with prior posters about the virtues of the FT897 as a mobile rig. I use the 897 mobile in a Prius, which is not a terribly large vehicle. Earlier, I used it in a Saab 9-3, also a relatively compact vehicle. It takes some ingenuity, but I think it's possible to devise a mount for the 897 for almost any vehicle.

Before I had the 897, I was running a Yaesu FT-8900, a quad-band rig that has a separable small control head. I mounted the rig in the trunk and the control head in the car. This is a great setup IF you never intend to remove the rig from the vehicle and use it as a base station or portable. I can disconnect the 897 antenna and power cables and move it into my house (or vice versa) in less than 60 seconds. It took 3 or 4 minutes to do the same procedure with the head-separated FT-8900.

for my money, the 897 is superior UNLESS you intend to mount it in a vehicle and not remove it until you sell the car.

I was thinking of putting the 897 into my Prius!

Have you found that the 12V battery is large enough to handle the radio?
Do you feel/worry the battery charging inverter can handle the load?

Though the battery can supply the large current demand of transmitting,
I was going to put a supplemental battery parallel to the main battery
with a 2 ohm 5 watt resistor to isolate them and connect the radio to
the supplemental battery.

My fear was blowing the 277->12volt inverter used to charge the small
12v Prius battery.

19664. AW: [FT897] (FT897) Radio has IF DSP??

Yahoo group: FT897 (2007)
Date: 2007-08-01 08:22:31 UTC
From: Frank
Topic: 19650 Message: 19664

Ollie,

No, the 897 doesn't have IP DSP, just audio DSP!! I'll sell my 897 and buy a IC-7400 because of the IF-DSP. My settings for HPF is about 2700-2900 and for LPF about 400. For me it increases the audio sound for ragchew and for DX.

Regards,
Frank

Hello
Does the ft-897 have IF (intermediate Freq) DSP?
Such as in DSP mode (dbf) key adjusting HPF and LPF?
What is a good setting for ragchew AND also for DX?
Thanks to all Ollie k0lqk

You might want to think about the 857D if you are mainly going to be mobile. Basically the same radio as the 897D, but intended for mobile and/or use indoors, whereas the 897D is intended for portable (with the int batteries fitted) or base operation with the mains psu fitted. Suggest you join the 857D group as well. There are a lot of operators who are on both lists, but worth thinking about.

19666. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2007)
Date: 2007-08-01 10:24:33 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 19666

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

Hello Rob,
Just a guess, as you know a short push on
the on / off button controls this feature.
If your PSU drops voltage on speech peaks
[SSB] the set might interpret this as if the
button had been pushed.
Worth checking for volts drop on the supply, the
supplied cable is very long hi, although I don't
get any problems on mine using the full cable
length and a Manson EP25 PSU.

I haven't found the 12V battery to be a problem. The current demand when transmitting is about 22 at 100 watts . I wouldn't want to use the vehicle's battery for transmitting on a high duty cycle, but most of my mobile use is on local repeaters while commuting, and I'm almost never transmitting for more than for two minutes or so at a time, on 2 meters, where the rig output is 50 watts and the current draw is about 12 amps.

I'm on the road, so I can't check the owners' manual, but I recall that they have a 10 amp fuse on the cigarette lighter jacks, so if you intend to transmit at full power, you'll need to run a cable directly from the 12V battery to the rig; good practice anyway.

The Prius does present real problems for a ham who intends to operate mobile on SSB bands. The inverter puts out awful amounts of noise, and even with the NB cranked up to max, it makes mobile DX very difficult. There are some postings around the Internet on how to dampen the RFI, but I haven't gotten around to implementing them yet. Lots of noise suppressors on cables, lots of grounding straps.....

The owner's manual also makes a big deal about not putting transmitters into the Prius because they'll fry the car's electronics. but Toyota also has issued a little pamphlet that says yes, you can do it. You just need to be careful about where you mount the antenna(s), and even more careful about where you route the coax cables from rig to antenna. I''l try to find a copy of that and send it to you when I get home.

Meantime, check out: http://www.hybridcars.com/forums/archive/amateur-radio-prius-t338.html

Enjoy your Prius! 50 MPG commuting is hard to beat.

Lew

The 897 is cool. It puts out 100 watts when powered by a car's battery and it's small enough that you can pick it up and just carry it around.

It can also be fitted with internal batteries that power it to 20 watts output.

Back in 1980, I drove from Halifax to Vancouver in a 1980 Honda Civic with a Kenwood TS430S under the dash. The 897 is MUCH more compact than that radio!

I bought it because it's good for both mobile and portable as well as being an acceptable base radio.

From: Craig
Topic: 19654 Message: 19676

I have many years and 88,000 miles experience with a Prius. It is assigned to my by the city. In the 4 years that I have been assigned the vehicle, I have been through four 12V batteries. I also have had the alternator replaced. It still will not start after a 4 or more day stretch of not driving. It did this before putting an 857 in it. It still does it after taking the 857 out of it. I now use VX7 handheld instead. I could use the radio on bands of 20 meters and above. Electrical noise masked everything below. The AM radio does not hear well downtown due to electrical noise as well.
It is assigned to me as a take home vehicle for emergency call but I take light rail to work (way more than 50 miles to the gallon). My VX7 works there too so I have not lost anything.

Thanks for all the advice

The overwhelming opinion seems to be RF in the shack, so my next project involves a bucket full of toroids and a few 6ft earth stakes and braid wires.

Others suggested that I might be inadvertently pushing the "fast" button on the mike. However, should have said that I am a CW man so not sure where the mike plugs in (or which drawer it is in)!

Thanks again

Rob

From: Rob, WB1AEX
Topic: 19669 Message: 19678

Hi Adrian,

Yah, the manual is a little tricky regarding doing this, but the 897 does split tone very nicely (CTCSS for encode and CTCSS for decode). Check text page 36 of the manual. Follow the directions exactly regarding menu No-079 to allow split tone operation (I'm guessing you already did that). Then dial up the receive frequency of your repeater and go to row MFd and select the correct offset + or -. Then go to row MFe and make a quick press of the ENC key to select T. Do the same for the DEC key to select T. This will instruct the radio that you want to do CTCSS for transmit and receive. Now hold in the ENC button momentarily to bring up the Tone frequency selection in the internal menu. It will say T:67 or whatever it was last set to. Use the VFO to select the tone you want. Press the F button momentarily to set that value and leave the menu. Now press the DEC button momentarily to return to the internal menu. Use the the MEM/VFO CH knob to move to menu No-083 (TONE FREQ). Ok, now here is where the trick is. Press in the MEM/VFO CH knob and you will see an underscore line blink under the T in front of the tone frequency you set for transmit. Move the main VFO knob to change this from T to R. Press in the MEM/VFO CH knob to lock this to R. Now use the VFO to dial up the CTCSS decode frequency you would like. Press the F key to leave the internal menu. Now save this to a memory slot!

It's tedious to do it manually, the memory software for this rig does it for you with a checkbox and dropdown tone select box for any frequency you program! Much easier!

I use split tone on a 6 meter repeater here (T=162.2 and R=100.0) and it works great.

Good luck!

19679. Type of output on external meter jack?

Yahoo group: FT897 (2007)
Date: 2007-08-03 23:01:52 UTC
From: thb201
Topic: 19679 Message: 19679

Hello group:

I was wondering if anyone knows what type of output is presented at the jack for the external meter (the jack on the bottom of the front panel for the LDG meter)? Using the "S Meter" mode I want to do some long term monitoring of signal strengths and I'd like to record this output on a chart recorder, or an A to D converter with a suitable recording program. Is this output a variable voltage or a variable current output? What would the range be? Thanks in advance.

How can I tell what the SWR is? What does each hash mark on the SWR bar mean? I have noticed that the 'highswr' doesn't light up until it passes what is the 's9' mark on the meter bar. My thinking is that each hash mark is .2 swr. With no bar showing is the SWR 1:1? one bar showing is 1.2:1? and so on...

Any thoughts?

Can someone tell me the matching CAT plug pins for CTS and RTS?

The Airmail software HELP section (Frequency Control) tells me to connect TxD, RxD, GND, CTS, and RTS at the CAT plug. The other end of the cable is at the SCS modem 13-pin DIN. I had already connected TxD, RxD, and GND, and the software changes the frequency and band automatically. It seems I need CTS and RTS at the CAT for handshaking.

What are the matching CAT pins for CTS and RTS? My remaining options at the CAT are RESET, BAND C, +13.8V, TX GND, and TX INH. None of these appear to be CTS or RTS. I thought the handshaking was to be done between the SCS modem and the computer via the DB-9 serial cable. Thanks, Lee in Arizona.

The CAT interface does not use CTS and RTS!

If your applications needs these signals to respond on the serial connection, then you need a CAT interface which connects these lines correctly at the RS-232 port.

Hi Todd,

If you have an external calibrated SWR meter you can check this yourself, but someone from this group did a very detailed analysis of this several years ago. I looked quickly through the files section here because I thought that is where I got it, but I did not see it. At any rate, using a calibrated meter, he came up with the following scale. The scale agrees very closely with my own calibrated meter so in my opinion he is pretty close to the mark.

Results using whole "ticks" or hash marks.

0 hash marks - 1:1 (perfect match - flat SWR)
1 hash marks - 1.15:1
2 hash marks - 1.33:1
3 hash marks - 1.55:1 (power starts to fold back here)
4 hash marks - 1.8:1
5 hash marks - 2.11:1
6 hash marks - 2.5:1
7 hash marks - 3:1 (here the high SWR "HSWR" starts to flash)

My own 897D behaves exactly as his did regarding fold back and the High SWR warning.

The 897 was not meant to "compete" with the ic-7000. The 897 is a Base/portable rig where the IC-7000 is strictly a Base rig. There is no comparison that I can see. The 897 has features that help you with a portable setup and operation that the 7000 doesn't have. Then again, I'm sure the 7000 has features the 897 doesn't have. If you want to do a comparison, then you need to look at the radios that Yeasu makes that are strictly meant to be a base radio.

The FT-897D SWR scale (like most single-needle SWR scales) is linear with respect to % reflected power. The correlation between fractional reflected power as a ratio (p) to forward power, and vSWR is given by:

vSWR = (1+p)/(1-p)

In my opinion, it is better to think of percentage of reflected power anyway (rather than SWR), and the scale is linear with respect to that.

Hi Adrian,

Glad you got the split tone function working ok! I use the ADMS software and they have provided separate columns that allow you to select the encode mode and the decode mode as well as a separate tone for each. It makes setting things up much easier than the convoluted menu method! I have no experience with the FTBasicMMO software so maybe someone who has worked with it can comment on its ability to set split tones.

Best regards,

Rob WB1AEX

No, the FT-1000 uses a round threaded, screw on type connector, the FT-897 is a flat, telephone-style push in plastic connector.-KC3VO, Bob.

>current output? What would the range be? Thanks in advance.

The external meter output is 0-5V with 4.7k ohms in series - you can
either use this straight into a high impedance and measure voltage, or
treat it as a 0-1mA current source and drive a 1mA FSD meter movement
directly, etc.

19698. RF GAIN Setting - how sensitive is the auto Squelch?

Yahoo group: FT897 (2007)
Date: 2007-08-06 06:54:08 UTC
From: roj_blake42
Topic: 19698 Message: 19698

Dear Group,

I run my 897 remote over the internet using Ham Radio Deluxe. Because I mainly work HF, I leave the RF GAIN / SQL setting on RF GAIN.

From reading other posts, I understand that when RF GAIN is selected, the radio has an "auto squelch" when used in FM / AM mode.

This seems correct because when I selected RF GAIN and used FM mode on 2 meters, the squelch was closed unless a signal was received.

My questions are:

1. How sensitive is the 897 to weak FM / AM signals when RF GAIN is selected and the rig is in FM / AM mode?

2. How strong is the auto squelch compared to the squelch level achieved by selecting the SQL option and setting the squelch dial just high enough to stop background noise from opening the receiver?

I want to know this because I would like to ensure I will not miss out on any distant / weak FM signals by using the auto squelch.

Not sure whether my rig is US or EURO model - think US because I bought it in Hong Kong.

Thanks and 73

Roj

You can probably solder up a 'converter pigtail'.
I used a small bit of a cat-5 ethernet cable and used that
to match up to an MD-1 mic (which is 8-pin, round).

The pinout of both the FT-897 and the MD-1 are in a 'how-to'
file I wrote up the Files section. It's easy to do and makes
good use of a nice older mic.

19700. New 897's now with good bias aligmnents out of the box?

Yahoo group: FT897 (2007)
Date: 2007-08-06 15:20:53 UTC
From: Axel Bak
Topic: 19700 Message: 19700

Hi all,

I was just wondering if it had occurred to Yaesu already that so many rigs were delivered with a tragical bias current misalignment, that made the rigs completely useless on SSB due to extreme non-linearity.

So are there any hams out there that got a new one out of the box with properly aligned bias currents?

A fellow ham here will buy his first new 897, so I would like to know if he will face the same problems or not!

Thank you for your replies,

and 73's

19701. Re: [FT897] Re: Speaking of the Ft-897D SWR Mtr

Yahoo group: FT897 (2007)
Date: 2007-08-06 17:26:02 UTC
From: Dean Gibson AE7Q
Topic: 19647 Message: 19701

Oops, that should read (thanks to Bob VK2BMU for the correction):

The FT-897D SWR scale (like most single-needle SWR scales) is linear with respect to % reflected VOLTAGE. The correlation between fractional reflected VOLTAGE as a ratio (v) to forward VOLTAGE, and vSWR is given by:

vSWR = (1+v)/(1-v)

In my opinion, it is better to think of percentage of reflected power anyway (rather than SWR). Since the scale is linear with respect to reflected voltage, squaring that gives percentage of reflected power.

Eg, if the SWR indication is half scale (50%), so is reflected voltage, and reflected power is then 25%. The SWR is 3:1, but who cares?

Since each mark on the FT-897 scale (except for the right-most two) are 1/14 of full scale, each mark represents 7% reflected voltage.

What are the symptoms of the mis-alignment? I have had several QSOs on
my three month old FT897D without any complaints.

Hi Glenn,
this has (had) been a major issue:

http://members.cox.net/wb1aex/897idle.html

This link is listed in the links section here as well.

It is good to learn that new FT-897D don't suffer from this problem
anymore.

Mine is 2 years old and I was getting very bad audio reports. So much so that many of the local amateurs said "send it back for an under-warrenty fix". Comments were "that's typical of the audio quality of those rigs".

I re-did the driver/PA bias adjestments as per Yaesu circuit diagram figures and fixed it. They were miles out (> 50% in some cases).

Better microphone helps too.

Will be interested to know if Yaesu are paying more attention to this in more recent production runs!

Axel,

Had mine five weeks now, and get mostly excellent reports on the SSB audio using just the standard out-of-the-box hand mike. Just on a couple of QSO's (out of many hundreds with this unit) have I had poor reports, once when I overdid the ALC setting (my fault obviously) and once or twice for no apparent reason at all. So I'm still occasionally prompting contacts to give me an audio report to see whether this "problem" might re-occur...

Hi Rob and all,

thank you for your replies.

I guess new 897's and 857's are leaving the factory now well-aligned.

Rob, what do you think is a reasonable response of the ALC meter in respect to the mic gain on SSB? What readings (or behavior) of the ALC meter on SSB are OK? I couldn't find any answers on this question as well.

Good question Axel. I was going to ask this one myself. What indication of the ALC meter to most operators run at? I have my SSB mic gain (meunu item #81) set at 25 and the indicator still goes quite high.
To quote the Operating manual Page 30 Point 4 under Basic Setup/Operation, "The ideal audio input level to the transmitter from the microphone will cause a few "segments" of indication on the ALC meter".
It seems to require very little audio input to achieve this!!!

What do ROB and others find??

Also - I have NEVER had any bad audio reports on FM mode since using my FT897D from day 1.

Thank you for the respond. My friend got a MD-200A8X and offered his
old microphone to me. I was not sure what it is but I THINK it is a
MD-100-A8X. I think that it is the Yaesu mic and it has a reversible
cable so it can work on the 857D. finally found a better discription
on the Universal radio site.

Hello Dave,
Incorrect biasing levels will not affect the speech
quality on FM, as the amplifiers do not need to be
linear. It's only on SSB and AM where the amp'
needs to be linear.

We have been on a dxpedition with several FT-897's.
Band filters (ICE) allowed us to work multiple bands the same time with close proximity of the antennas.
One of the FT-897 caused more noise than all the others, so we checked the menu settings, but could not find anything.
I guess the bias setting of this radio is wrong and I will check it soon and also the other FT-897's we used. Will post the results here.

Hi Dave,

exactly, that is what I meant. The manual says 'a few segments', which are reached already by whispering into the mic with a gain setting of 2 (menu 81). Everybody drives the ALC meter to higher levels, but: to what levels approximately?

Btw, this question is deeply related to the HFx-REV-ALC settings in the service menu, which are often readjusted by hams. You can find a lot of information about this in the group. The FT-897 is known for reacting very 'nervously' to SWR > 0.5, which results in very 'nervous' ALC behavior. This can easily be settled by making these adjustments.

Thus, comparing ALC meter behavior@SSB can only be done properly if these settings are taken in regard. My settings for HF1-REV-ALC, HF2-REV-ALC and HF3-REV-ALC are all 75, as recommended by DG2IAQ.

Cheers,
Axel, PA1XL

Hi all
Good questions being answered as usual

I have my SSB Mic level set at #80 and have nothing but good to impressive reports for my audio. I came to this setting after talking to a good mate who is an old campaigner with an FT-857 which we all know is the same in a different case.

hope this helps

Ian

Hi Jürgen,

good idea to check these bias values.

There are many hams that have been using the FT-897 for years and are really unsatisfied with its SSB audio performance on TX. Many of them may have wrong bias settings without even knowing it! That means: Quite some radio fun spoiled unnecessarily.

Let us know your results!

Would it be possible for OM's who have had ."Bad Bias Settings". to send me the first four characters of the serial number (number-letter and next two numbers) and on which band the improper bias was measured. We have had several hundred 817, 857 and 897 in the service shop for repair, updates, accessory installation, frequency expansions etc. Step 4 in our final test procedure before any radio is released for invoicing and return to owner is a Two Tone SSB modulation check on HF/6M, VHF and UHF. To date we have never had a radio that failed this test because of improper bias.

We have noted , especially with the 100 Watt 857 and 897, that the SSB modulation is quickly degraded as the VSWR increases. We have also noted that with some, not all radios, the SSB Modulation quality is some what (read wee bit) better after a few minutes of operation. This is probably because of the hfe spread in the final transistors. When this is the case we give then10 to 20 mA. more and check the results. (Published hfe spread is 10 to 180.)

Hi Don,

as soon as I have time to unbolt my AT-897, I will send you the serial number. Good idea to make an inventarisation on this. Hope that many hams will bring up their serial numbers here (or at least first four chars).

I just don't understand what you mean by "Hfe spread". I couldn't find this in the service manual either. I know what Hfe means, but "spread" sounds to me, as a half-grown-techie, more like something to put on your bread :) Can you explain this?

Cheers,

Date: 2007-08-10 17:32:10 UTC
From: Rob, WB1AEX
Topic: 19700 Message: 19724

Hi Don,

My 897D is a 4H37xxxx which suffered from the incorrect factory bias settings listed below (measured @ 1.8 mHz):

Pre-Driver resting current: 25 ma (should be 35 ma)
Driver resting current: 56 ma (should be 30 ma)
Exciter stage total resting current: 80 ma (should be a sum of 200 ma for both exciter transistors)
Exciter transistor number one: 10 ma (should be 100 ma)
Exciter transistor number two: 70 ma (should be 100 ma)
HF Power Amplifier transistors: 82 ma (should be 300 ma)
VHF/UHF Power Amplifier: 232 ma (should be 300 ma)

The factory settings were so poor that my PA was operating close to cut-off and the resulting signal was gritty and distorted sounding. On 6 meters it was almost unintelligible. Many operators assume that they are suffering from severe RF feedback because it mimics that type of distortion.

I check the bias about every 6 months and have found that the HF exciter and PA idling current invariably stray low each time. I have been setting the exciter stage at around 220 ma total and the PA at 400 ma total and have never gotten a bad report since doing that. The Pre-driver and driver stages seem to remain stable and have never needed adjustment on my rig following my first adjustment to spec.

It is a very touchy adjustment, and my guess is that thermal variation probably is a factor in the straying values. I would suggest letting the rig warm up for at least 30 minutes before measuring and adjusting.

73,

Rob

In either case you'll want to make space for a separate speaker. The installed one in both cases is pretty bad.

If you switch often between operating modes the 7000 makes life MUCH easier.

For base operating IMO the benefits of the IC-7000 is not worth the extra money. For mobile IMO the IC-7000 is worth the premium.

Personally I use the 7000 in my primary vehicle and use the 897 for base and when in other vehicles.

Personally I would pick none of the above and make room for a 746 pro. The 897 is not _that_ much smaller, especially if using an external power supply.

With no modulation while in SSB mode --- no power out. Unless you speak or produce a tone into the microphone there is no output (on a wattmeter).

so unless you change modes to AM, FM or PKT mode you wont get an indication.

If you tried AM then you must have a problem...

hope this helps.

Indeed,

I'm afraid that there is indeed a hardware failure.
Luckely i could test the transmitter before buying.
It isn't that big problem (processor),but the price was not right to live with this problem.

Better luck nest time.

After my initial response to Axel's(PA1XL) posting and seeing the responses of several people, I opened up my 4 month old 4F34xxxx unit and found almost exactly the same incorrect settings as listed below.

I've easily re-adjusted my radio in a few minutes thanks to the link.

Since I have not had any complaints, I'm not sure what to say about people having bad audio. It could be that all my HF contacts were DX and nobody ever made comment.

Anyway, if there is anybody in the Denver metro area that would like some help doing this alignment, don't hesitate asking! I would be glad to help.

Hello Axel,
You don't seem to have had a reply on your query
"what is Hfe spread"? When a manufacturer
makes a transistor it is intended to have a certain
Hfe. Due to manufacturing and material tolerances
the Hfe of the produced transistor will vary.
The manufacturer will will quote a range [or SPREAD]
of Hfe that any given transistor type can have.

The MD-100A8X microphone ships with a reversable cable that allows use with either Yaesu's 8-pin mic jack or Yaesu's modular mic jack. It's a great mic and I use it with both my FT-1000D/Quadra Amp and my FT-897.

Yaesu/Vertex Standard is notorious for never answering emails which is just one of a plethora of reasons why I have bought my last Yaesu rig after 35 years of buying them. From now on it's Elecraft and Ten Tec for me.

Hi Glenn,

I used my 897D for about 6 months and only got bad audio reports now and then. I figured that the 897D family of radios might just sound harsh to some ears. But then a friend asked me to work him locally so he could test a new antenna he had put up, and that is when I discovered that the audio would go nasty when I worked into an SWR that engaged the SWR protective clamp. He was a big help in determining this as we moved up and down the band and he reported the non-linear signal as I moved away from the resonant point of my antenna. When we moved back to resonance, the 897D sounded fine again.

My conclusion is that even with my poor factory settings, the rig was operating above cut-off as long as I was not in a situation where the SWR protection engaged. As soon as the protective circuit began clamping, either the driver stage or PA began operating at cut-off, and it all fell apart. The signal was best described as very harsh, gritty, and distorted.

Once I did the bias alignment, and all the stages were operating in a linear manner, the SWR clamp had no ill effects on the quality of the signal. In fact, the 897/857 family of radios actually produce excellent sounding SSB audio when they are biased correctly. They are very natural and pleasant to listen to.

Glad you got yours squared away!

73,

Rob WB1AEX

19737. Transverter frequency set -men 89- how to set 70.000 Mhz ??

Yahoo group: FT897 (2007)
Date: 2007-08-10 22:19:24 UTC
From: Graham
Topic: 19737 Message: 19737

Sorry if this has beed asked befor, but I dont seem to be able to set
a frequency of 70.000 MHz , set freq (145.000 MHz)
I can set 7000.000.00, but if I try and set 0070.000.00 it wont take it

is there a way of setting 70.000.00 ? ie loosing the first two
digits .. I assume there is but what input sequence is needed ?

Tnx G ..

Nb .. noted the software power reduction .. that very handy !

Hi,

Don't have the IC-7000, but have the FT-817, FT-857, FT-897 and the IC-746 Pro.

What all the three FTs have and the neither the IC-7000 nor the IC-746 Pro has is the combination, of both IF crystal filters (i.e. YF-122, YF-122C and YF-122CN) and DSP.

Icom relies only on IF DSP, and I don't think that's good enough, in all honesty. Ten-Tec Orion II etc high up in the Sherwood list offer a variety of Xtal filters as well as the DSP.
Also check QST product reviews for Dynamic Range figures etc.
Cheers,
Tim (M0SVA)

From: handbell_guy
Topic: 19742 Message: 19742

Just bought a new (used) FT897D with FC-30, FP-30 & CT-62 included. Tried to run the stock ADMS-4B SW with the cable that came with the radio through a USB-Serial converter (double checking all the while to make sure my comm port was set correctly) and I get "error" when trying to send current programing from Radio to PC.

Purchsed and tried FTBasicMMO with the same results.

I have an FT8900 and a VX5R that I am able to program vi PC interface but I'm not having any luck with the FT897D. Any suggestions from this agust body of HAMS???

From: Rob, WB1AEX
Topic: 19743 Message: 19746

Hi Rick,

Assuming the USB port is not indicating any issues in windows device manager, and that the correct port is selected in the ADMS drop down menu under the "Radio" menu item, the next thing I would try is a lower baud rate in the 897D user menu (CAT RATE menu #019). I think I ended up using 4800 because at higher speed settings I could hear polling noise when operating with Ham Radio Deluxe.

I have found that some of the USB-Serial converters are unhappy unless they are given port 1 or 2 (the Icom converter comes to mind here), so if you are up on port 3 or 4 you might try unplugging the 8900 or VX5 and going in there. I ended up moving my VX7 software over to a second computer and leaving my 8900 and 897 on a different computer because of issues with connecting on ports 3 and 4.

Good luck!

19750. Ft897 tansverter display mode .. how ??????

Yahoo group: FT897 (2007)
Date: 2007-08-11 19:17:14 UTC
From: Graham
Topic: 19750 Message: 19750

John,

Just noticed your post about transverter mode .. etc

At risk of looking 'daft' lol '' I cannot get the set to memorises
the transverter frequency ..

running 145.000 MHz , to give 70.000 MHz from the transverter ..
can select the transveter mode, -mem91- -a- can see and select the
off set freq -mem89- but if i press the mem/vfo switch and enter a
freq of 70,000 , press -f- it wont store ...

as soone as the mem/ch switch is depressed , the display shows all
nine digits , which can be slected by rotating the control,
0000.000.00 , the value can then be set by the main dial ...

Q, what keying sequence have you used to store the frequency,
assuming you have of course ?

before starting, sets showing what i assume norma display VFOa .. It
looks like im the right area .. but ive missed something ?

Rgds

Graham ..

19752. Any Digital Ops (psk,mfsk,olivia,rtty,etc) here? If so give 30m a try

Yahoo group: FT897 (2007)
Date: 2007-08-12 05:38:35 UTC
From: Don
Topic: 19752 Message: 19752

GM,

If you haven't tried 30 meter PSK then jump in and give it a try.
There will be activity on 10 mhz promoting PSK on Thursday and Sunday
Nights (02:00 to 4:00 UTC). All digital ops welcome, if you have time
and are operating/switching on 20 or 40 meter PSK please stop in on 30
meters 10.140 +1000 for some PSK activity (tune up what you have and
give it a go!).
Give it a try 30 meters on Thur/Sun Nights, hope to see you on the
waterfall.

Or join in for more information at:
http://groups.yahoo.com/group/30meterPSKGroup/

For 30 Meter Digital Spots:
http://www.projectsandparts.com/30m/
(Spot page via Sholto KE7HPV)

Promoting PSK and digital on 30 meters! So far lots of fun and have
had
good number of PSK ops join in and some DX ops also. Let's try to
increase and support
PSK on a great digital band.....give 30 meters a try.

Thanks
de kb9umt Don

From: Axel Bak
Topic: 19733 Message: 19757

Hi All,

thanks for your replies.

Yes, I knew that hFE is current gain. But the following comment from Dan Taylor was not clear to me:

"This is probably because of the hfe spread in the final transistors. When this is the case we give then 10 to 20 mA more and check the results."

Yahoo group: FT897 (2007)
Date: 2007-08-13 06:34:33 UTC
From: Bill Carter
Topic: 19693 Message: 19758

Turns out the mic my friend had was an MD1,with round
connector. We took the cable from his new MD-200A8X
mic
and put it on the MD1.The MD-100 and 200 come with
what they call a reversible cable.We took the cable
from the MD1 and put it on the MD200. The new mic's
come with both a round and a modular[I think that's
what those phone like plugs are called]connector on
the bass. So it worked out. The 2 outside buttons
don't work so I use the buttons on the radio for scan.
Now to get it adjusted right. Not sure where to set
the mic gain. Default 50.
Any suggestions? Thanks for all replies.
Bill

Anybody, please correct or add as fit but as I understand it...

The AM and SSB signal path needs to be maintained in a linear area of
the transistors to maintain purity (low distortion and low harmonics)

What was found in the FT-897 was that the HF exciter, driver and output
transistors had their factory settings adjusted way off as compared to
the service manual so-that when operated in some situations, made the
transmitted audio raspy and distorted as these settings were near
cut-off of the transistor's performance curve. The alignment (which
involves opening the radio and adjusting pots and not a menu item)
places the modulated rf signal into the more linear range of the transistor.

OK OK so I'm trainable and just figured out that not only does Menu Mode #020 have to be set to CAT but Memue Mode #085 must be set to OFF to allow #020 to be set to CAT. But it doesn't seem to matter cause I still can't read my radios memory. (I'm counting to 10 SLOWLY)

19777. For sale and more

Yahoo group: FT897 (2007)
Date: 2007-08-14 08:38:18 UTC
From: Axel Bak
Topic: 19777 Message: 19777

Hi All,

after 2 years of operating a FT-897D, I put it on eBay now (item number 200141087582). I enjoyed this radio very much, however. The reasons for the sale:

1. I never used internal batteries and missed the convenience of a remote panel.
2. I would like to have two separate radios for HF/6 and 2/70.
3. It turned out to be too big and too heavy for portable use.

I will buy a TS-480SAT instead, but I'm still looking for a neat VHF/UHF rig with remote panel. This could be a FT-857D as well, because on VHF/UHF it is all-mode, has a built-in SWR meter, a remote panel and I can still use some accessories that I already have.

My questions:

Do you think that the FT-857D is a good performer on VHF/UHF compared to dedicated VHF/UHF rigs? I am not much of a digital mode man on VHF/UHF, so such bells and whistles of dedicated VHF/UHF rigs don't matter to me.

Are there any dedicated VHF/UHF rigs with built-in SWR meter? Me, I haven't found one yet. I really like this feature because I hate to carry too much equipment around on a field trip.

Thank you for your replies!

Axel, PA1XL

I'm tired and I want to go to bed, BUT. I almost have it working.
Found bent pin in mini DIN connector.
Was finally able to read radio memory into my PC.
HOWEVER when I edited a few locations and tried a "test save" back
to the radio it tells me the save was successful but when I turn the
radio off and back on to get out of clone mode. My radios memory is
wipped out and nothing was saved. Now I'm really confused.

Take a look at this:
http://www.w4wb.com/FT-817-Accessories/One-BIG-Punch.htm

A built-in speech compressor, with option to add switchable Heil HC-4
and HC-5 elements (for DX vs rag-chew). Self-install and pro-install
versions from $49 to $205.

I have no connection to this vendor.

Regards,
Mike ND9X

No, but not enough to justify installing a second rig even if it is free. However not having to mess with changing the different settings when changing modes is enough to justify a second rig IMO.

The 857 is a great rig, but IMO, the only drawback is the 20 watt limit on UHF. Vhf gives you 50 watts and performs GREAT - even on SSB.

Enjoy!

I'm talking repeaters here.
Your right 20 watts on UHF with a external antenna. But my 5 watt ht works great with a rubber ducky.. I run 10 watts on VHF/UHF for repeaters on my 8X7. If I need more then I'm not making it in to the repeater. So by doubling the power to 20 watts give us 3db. We need 6db to raise one S signal. So if your a S2 at 10 watts in to the repeater, to raise it one S signal you would need 40 watts. So your at a S3 in to the repeater. Your still not making it. I would look at a better antenna.

Now if your talking simplex? Yep turn up the power..... I would use an AMP save the radio.

It is a MD1. nice mic.I am not sure about setting the mic gain. I started out using a Drake TR3,then went to a Kenwood TS 130S and I knew how to set the gain on those. I have not mastered the multitude of settings on the 897D. Any suggestions for a starting point for settings.
I would be interested in what others are using for settings.

OH - I misread or something. That's the exact mic I have.
Got it from an equipment sale at our club. VERY nice mic, and
I've received very good audio reports.

Just check on Page 30 of the manual (PDF if you don't have the
original paper booklet). The page tells you each key/button
to press, but basically:

1. Set the meter to ALC
2. Press PTT and talk in a NORMAL (not shouting, not low, voice)
3. The IDEAL level is with a FEW segments of ALC indication on
the meter. Not all the way to the right; not just one segment
from the left.
4. If it's not (what the manual calls...) a FEW - move the
SSB Mic gain up or down accordingly.
5. Lather, Rinse, Repeat (2 - 4 until you get maybe 4 to 6
tick-marks or segments on the ALC meter).

You'll probably want to do the same for FM Mic Gain too (Page
34 in the booklet). Instructions tell you to set the meter to
'DEVIATION' rather than ALC, but the procedure is the same -
they want you to adjust the FM Mic Gain 'til you see about 8
'bars' or ticks on the meter ON VOICE PEAKS and less for 'normal'
voice.

The default settings, if I remember correctly for SSB, was 50
and is way too high. Once you set these for this mic, you won't
have to do it again.

I'm using the MD-1C and I think I'm using about 20 on SSB gain,
maybe 10 PROC level.

I thought the menus would be very difficult, but actually, once
you setup a few basic items, you really only use a few settings
(based on your habits). Most of the common menu items are 'PRESS
AND HOLD' to get to the details - make your change - then you
back out. If I'm on SSB, I usually am at the first menu
(A/B, A=B, SPLIT)...

19791. Diesel engine RFI

Yahoo group: FT897 (2007)
Date: 2007-08-16 00:02:18 UTC
From: tim pap
Topic: 19791 Message: 19791

Hi all,
Lots of horrible rat-tat-tat interference when diesel engine is running / being rev-ed. Have tried FT-857D & FT-897 with noise blanker and both radio and ATAS-120, were grounded to the chassis. Noise blanker got S9 noise to S4 to S5. Good but there go all other stations on 20m band under S4 or S5.
Lots of RFI on 20m band, all across it.

Interestingly, when the engine is on and I happen to drive downhill, if I take my foot off the accelerator and let the engine in gear, the engine interference stops, despite the engine running.

What do you reckon this can show? The noise comes from Alternator, or from Common rail (high pressure rod for fuel injection at huge pressures)?

Any pointers please anyone?

Thank you all,

Tim

19795. RE: [FT897] Diesel engine RFI

Yahoo group: FT897 (2007)
Date: 2007-08-16 02:20:14 UTC
From: dalite01@bellsouth.net
Topic: 19791 Message: 19795

Injectors.

Depending on the manufacturer, there may be a fuel management module that is a part of the computer (PCU, ECM, etc) that handles fuel flow. Think of the injector control as in distributor, and dwell. The duration the injector is turned on indicates the demand for fuel. At idle (downhill) no demand. On acceleration, big demand.

Maintaining constant speed on flat surface, lower pitch interference, under load, higher pitch (shorter duration, more closely spaced pulses).

No promises, but my guess is injector or fuel management system.

Solution: join a user group for that particular brand an year model range of the vehicle and pose the question to the group. Chances are that somebody has already encountered the problem and may have a solution to share.

You are experiencing RFI from your fuel injection/engine control system. Additional shielding, grounding, and bypassing of the vehicle electrical system will be required. (ferrite cores, .01uf capacitors, braided ground leads, etc.)--Good luck & 73, KC3VO-Bob Curry

You did not say who makes the engine. The alternator would probably not be the problem as it continues to generate electricity regardless of the throttle position. The common rail may be the problem, but if it were me I would go to the dealer and ask the mechanic what changes when the accelerator is released and the engine is winding down. In a Ford diesel there are obvious changes when the throttle is released and then pushed down about 1/4 inch. Good luck.73...Bob...AD7LJ Board Member Radio Club of Tacoma

19799. RE: [FT897] PL259 right angle-$80.00 is CRAZY for use at 500 mhz or less!

Yahoo group: FT897 (2007)
Date: 2007-08-16 00:40:39 UTC
From: John Maguire
Topic: 19773 Message: 19799

A long time ago, QST had a write up by a ham who had high SWR and spent a long fruitless search trying to figure out what the problem was. After much effort, he isolated it to a Radio Shack right angle coax connector. Unbelieving, he checked it with an ohm meter and there was no continuity. Holding it in his hand, he felt this was impossible! He then put it into a vise like attachment and at a 45 degree angle ground off the solid corner so that he could inspect the connection between the male and female side of the connector. He found that the unit had been manufactured with a coiled spring stretched over a pin extending from each side of the connector. In other words, a small diameter coil connected the two sides of the connector. In his case, high power had fused the connecting spring.

We get what we pay for. There is a reason an Amphenol connector costs more than a Radio Shack connector. $80 is not the answer that I would suggest however. Is it possible to use this internet to purchase a quality connector from a catalogue source - perhaps Newark, or surplus from Fair Radio, etc?

19800. computer connection with FC-30 attached

Yahoo group: FT897 (2007)
Date: 2007-08-15 20:16:07 UTC
From: Timothy A. Knotts
Topic: 19800 Message: 19800

I know that the LDG AT-897 automatic antenna tuner has two control outlets that allow you to auto-tune the FT-897, and at the same time connect your rig to your computer.

But....I own the Yaesu FC-30 automatic antenna tuner that only has one control outlet for communicating with the FT-897 through a control cable connected to the CAT/Linear outlet on the back of the FT-897. With this set up on my rig is there an alternative for getting the second connection to my computer (short of the obvious - buy the LDG AT-897)?

Thanks, Tim

From: chris_bridgehouse
Topic: 19801 Message: 19801

Hi all, Last night my 897 was doing weird things. I was listening to some dx on 3.799 and as i was looking at the radio it suddenly changed frequency to 3.802.5 all by itself. It did this several times. I found some other stations on 3.705 and after a couple of minutes it changed again to 3.710. I decided to try it on 40m so i put it on 7.133 and went for a shower. When i came back to the radio it was tuned to 7.142.5.
I`ve had the radio on today and as yet it hasn`t happened again but it was really bizzare. Has anybody else ever had this problem and if so what was the cause?

Cheers.

Chris, ZL1BR

Ken I get your point , but thats still not showing the expected transvertor out put frequency ?

... If you set -89- to 7000.000.00 and press -f- , i get a display feq of , 6999.899.60 , -odd- but it is stored.. and when tvr mode -a- is slected, the main dial tunes as normal, ie the frequency displayed is 6.999 GHz the main dial is still changing the digits from the first digit on the right hand side of the display ?

Topic: 19743 Message: 19803

The following two USB-to-Serial converters work perfectly with my FT-897D:

Keyspan USA-19HS
http://www.keyspan.com/products/usb/usa19hs/homepage.spml

IOgear GUC232A
http://www.iogear.com/main.php?loc=product&Item=GUC232A

I do quite a bit of programming and debugging with both of these adapters. In my opinion, the Keyspan is better since it provides a wealth of controls and functions in the software. The IOgear can be a bit more difficult to work with since it assigns itself a new COM port each and every time that you plug it into a different USB port. You just need to remember to use the same USB port all the time.

Thats not quite righ,

I you do that , your are displaying 7 GHz , and the main tune still works from the right had digit , ie the 10 Hz steps ... still not sorted the problem ... managed to set the vhf low power down to 1 watt with the software change but , still not the frequency display ..

Tnx - G ..

19808. RE: [FT897] Diesel engine RFI

Yahoo group: FT897 (2007)
Date: 2007-08-16 07:08:01 UTC
From: Mark Vaughan
Topic: 19791 Message: 19808

Sounds like noise is from your electric diesel injectors, when you coast, or go down hill on low throttle the engine will shut these off. A rat a tat noise is typical of injectors, alternator would be a hi pitched wine..

Depending on how bad, try ferrite beads, on the harness across the back of the injectors, clip on ferrites are easy to fit and avoid cutting into any looms..

Sometimes you need a capacitor filter, between each conductor, and also sometimes from each conductor down to the engine.

When it's really bad, filtering there becomes a problem and people resort to screening the injector cables but this is rare.

Sent: 16 August 2007 01:02
To: FT897@yahoogroups.com
Subject: [FT897] Diesel engine RFI

Hi all,
Lots of horrible rat-tat-tat interference when diesel engine is running / being rev-ed.
Have tried FT-857D & FT-897 with noise blanker and both radio and ATAS-120, were grounded to the chassis. Noise blanker got S9 noise to S4 to S5. Good but there go all other stations on 20m band under S4 or S5.
Lots of RFI on 20m band, all across it.

Interestingly, when the engine is on and I happen to drive downhill, if I take my foot off the accelerator and let the engine in gear, the engine interference stops, despite the engine running.

What do you reckon this can show? The noise comes from Alternator, or from Common rail (high pressure rod for fuel injection at huge pressures)?

Any pointers please anyone?

Thank you all,

Tim

Tim,

If it was the alternator the interference would be
there more or less all the time - level / frequency
would vary with engine speed (had this problem with my
old LR Discovery diesel - turned out to be the feed
for the rev-counter).

It sounds to me like a problem with fuel injection,
however, check the throtttle cable / pedal etc. are
properly earthed first (I've seen that be a problem on
petrol engined cars).

Good luck!

Hi Tim. Sounds like you're in the same boat I was. I took the easy way out, and bought the AT-897, still have the FC-30 in a box, if you want a spare ;-)

If you search the archives of this group, there is a way to get CAT control via the mic connector. I believe there are plans for an adapter box floating around to get the CAT out, too.

Subject: [FT897] computer connection with FC-30 attached

I know that the LDG AT-897 automatic antenna tuner has two control outlets that allow you to auto-tune the FT-897, and at the same time connect your rig to your computer.

But....I own the Yaesu FC-30 automatic antenna tuner that only has one control outlet for communicating with the FT-897 through a control cable connected to the CAT/Linear outlet on the back of the FT-897. With this set up on my rig is there an alternative for getting the second connection to my computer (short of the obvious - buy the LDG AT-897)?

Thanks, Tim

I had the same thing happen to me. I used three of the right angle
connectors in my setup and was not hearing or getting out to good.
They were fine when I first used them but over time my signals
were not heard very well. I thought my transceiver was gone.
I took the right angle connectors off and hooked the coax
direct and I thought I had a new rig. I would not use the
right angle connectors. The little spring will not hold up
to high power.

There is a difference between right angle
plugs and right angle connectors [or adapters].
A lot of the adapters on the market are indeed
rubbish. But there are some good quality right
angle plugs available. I have some surplus
plugs I bought at a rally, there is a small disc
which screws off the back of the plug and you
use this to access the centre connection when
soldering coax into the plug. I have seen the same
system used on BNC and N types.

Hello Graham,
My first comment was from reading the manual
but after your reply I tried it for myself.
How did you enter 70 MHz ? I think you said you
wanted 144 MHz as the IF.
I put the 897 on 144 MHz and then went to menu
089. I tried to tune down to 70 MHz. The set would not
let me tune lower than 143.9 MHz.
I then tuned the set to 50 MHz and went to menu 089.
I could then tune up to 70 MHz on the display and
entered it [ie pressed F again]. This worked fine,
that is 70 MHz display with 50 MHz IF. The tuning
worked fine and the display was correct.
I suspect that you can't enter a frequency lower than
the IF [except for 100 KHz which is to allow for calibration].
I will play with it again later as I wish to put 1296 MHz on
the display with 144 MHz IF. [I don't know how I'm going to
enter it though, I'll be spinning the dial for ever.]
If I discover anything interesting I'll let you know.
I have to say that the transverter display is a good idea but very
badly implemented on the FT897.

I called Tigertronics a couple of days ago to order my Signalink USB only to find they are still 4 to 6 weeks delayed in shipping.
Good news is I found some available on EBAY with "BUY IT NOW" and they are only $95 plus shipping. There are still 5 available.
I have no interest in the sale of these. I'm just one happy camper to find one!!!

Hello group
I have a question about my ft897d. I bought this unit new about a year and a half ago and have used it for cw only, and now i have a ft2000d that i use in the home, and would like to use the 897d as a mobile. Everyone i talk to says the audio is distorted and sounds like a high pitch audio. I have never tried it on ssb untill today and the mike is stock never used. Any suggestions would be appreciated.
thanks Dennis W5VAF

Hello Dennis,
Try changing the carrier frequency.
Menu 016 for LSB Tx
Menu 018 for USB Tx
Try small adjustments and get reports on air.

Hi all and thanks for your support and great ideas.

Tonight, as I was driving back home, I noticed that if I turned down the RF gain, the engine noise on my 857D would be reduced drastically, even by joust a bit of turning the concentric RF Gain knob.

In the meantime, and until your ideas help resolve the issue, I have sent my engine ....a QSL card, maybe it was all about establishing ..radio contact with me...
Haven't received though a QSL card back from my Toyota Yaris 4D4 engine, ... hi-hi

Last but not least, does anyone know, whether the Noise blanker is at AF level or IF level? I suspect it is at AF level, and if DSP was at IF, it may have been more effective..? Wishful thinking?

Cheers everyone, have a good weekend,

Boy, that is the truth! I would recommend buying the one RT Systems sells on their web site. Trying to find a USB-to-Serial adaptor that'll work with the software you're wanting to use, will make you crazy. The one they sell seems to work with just about all radio programming software I use. It also works with the GPS unit I use with my Delorme software.

19836. Optional filters for FT-897D

Yahoo group: FT897 (2007)
Date: 2007-08-18 19:30:18 UTC
From: Dennis Featherstone
Topic: 19836 Message: 19836

I have to assume that the DSP on the 897D is at the AF stage rather than at the IF stage, due to the fact that the AGC still acts on signals outside the passband selected with the hi-cut and lo-cut DSP filters (for example on RTTY and PSK31).

Do the optional mechanical filters work more like IF stage DSP, in other words preventing AGC "pumping" outside the passband of the filter? Also, is 300 Hz the narrowest filter I can get for this rig?

Thanks!

Dennis - KE5KZX

Have the same issue, tried a switchbox between the FC-30 and the CAT control cable. To select CAT when I want to use CAT Features alone, back to Tuner when I need to Tune.
Down side is your have to go back into the radio and change menus to reflect CAT or TUNER.
In the interim have an old manual MFJ tuner doing the dirty work.
Will be investing in one of the LDG's shortly myself. So I too have an excess FC-30 "in da box". hi hi

19839. Been asked a 1000 times I know - FT-897D MARS Mod

Yahoo group: FT897 (2007)
Date: 2007-08-17 16:48:39 UTC
From: Ron
Topic: 19839 Message: 19839

I need a board level expert to address this.
The Jumper Pads 1-9 for resetting to wideband ops. I lost J7 due to overheat when trying to jump it. Yaesu fixed it but didn't restore the missing side. I have a hole where that half of the jumper would be.

So the question is on J7 what do I actually jumper the leg of the to? Is it a simple jump to ground or what? Am unsure what they jumpers are connecting when jumped, do they bypass or ground the circuit?

If it's a ground issue could I just jumper the remaining side to ground via wire?

I need this radio to operate out of band for MARS. Have modded several 857's whithout a problem just the Brand spanking new 897 has given me issues. Software jumping does not work tried Widebanderv4 and Softjump, no joy there.

Help?

19840. Re: computer connection with FC-30 attached

Yahoo group: FT897 (2007)
Date: 2007-08-17 12:27:03 UTC
From: Timothy A. Knotts
Topic: 19800 Message: 19840

Ken,

Thanks for the suggestion. I went back into the archives (should have started there first I suppose!), which led me to the ZLP Electronics web site: http://www.g4zlp.co.uk/unified/DigiMasterUSBMultiFace.htm. Disclaimer: I do not, nor does anyone in my family, have any financial connection to this company.

In response to my question, Neil e-mailed me back, "Yes, the "MultiFace" and "Y4" cable, allows CAT operation via the mic, and adaptor connects mic back into circuit."

So, this apparently allows the Yaesu FC-30 auto antenna tuner, and a connection between the rig and a computer (for control, logging and/or programming), to both "co-exist" on the FT-897 at the same time, and still allows the use of the mic. It also looks like the solution is less expensive than scraping the FC-30 and buying the LDG AT-897. Neil from ZLP Electronics also suggested I read: http://www.g4zlp.co.uk/Instructions/Y4%20cable%20instructions.pdf.

Now, my next question to the group, naturally: is anyone on this user group using the ZLP electronics Multiface and Y4 cable, and has there been any problems?

73,
Tim Knotts

From: kc3vo@aol.com
Topic: 19737 Message: 19842

Using 144 mhz as IF for 70 mhz transverter seems a poor choice, as the local oscillator may de-sense the receiver, and the local oscillator may be transmitted, if 74 mhz is the local oscillator! A 214 mhz local oscillator may work, but your IF radio would tune backwards. Best bet is use a FT-847 (which can cover this band directly) or a different conversion scheme. (unless your transverter uses DOUBLE conversion)-73, KC3VO, Bob Curry

Hi Tim,

Greetings from a wet grey Felixstowe here in SE UK. I have an FT897D and I am a user of the ZLP equipment, I use the Y4 and the Digimaster Pro (a USB CAT and Digimodes interface) and can honestly say that they are excellent quality. Neil (G4ZLP) is very helpful, sends purchases well packaged and sends them very quickly. Like above I have no connection with Neil other than being a very satisfied customer.

I only use Linux on my station PC and the drivers for the USB-Serial chip built into the interface are loaded automatically, Both Digimodes and CAT work perfectly. The Win XP machine in the house also works well, loading drivers automatically, drivers are also available for Win 98 and are very easy to install.

There is only one thing to beware of and that is a Yaesu thing! The FT897 will not let you program the memories using the Mic connector as a CAT, if you need to program the memories you will need the use the CAT connection on the rear of the radio, as I said this is a YAESU thing not ZLP.

Hope this helps you all,

Best regards

Andrew - G7MNS

Hello Bob,
Microwave modules made transverters for 4m with
various IF frequencies. Using 2m as an IF the first
models they produced did use double conversion,
down to 28 MHz then back up to 70 MHz.
This model used a pair of FETs as mixer. Later they
used a double balanced mixer IC and went to single
conversion. With the IC well balanced and filtering
of the output the 74 MHz leak through was very low,
it had to be, 74 MHz is in the middle of a band used
by Fire services here. I have built transverters using
single conversion and have had no problems, my local
fire station is only 1 mile away. I do use a high Q break
in the aerial lead though, otherwise they clobber me hi.
The FT847 is very poor on 4m, the Rx is deaf as a post
and the Tx is very inefficient. There are a few mod's
about for altering the output filtering to improve it, but
that's not for everyone.

I have heard of the FT-847 being used on 70 mhz successfully by feeding it into an external Power amp/preamp combination, which correct the poor receive performance and low output. If 6 meters is not needed, the 6 meter filters can be modified, and the receive/tx performance will greatly improve on 70 mhz.-Otherwise, maybe you could find a 28 mhz IF converter?---73, KC3VO

19847. Re:Optional filters for FT-897D

Yahoo group: FT897 (2007)
Date: 2007-08-19 11:51:46 UTC
From: tim pap
Topic: 19836 Message: 19847

Hi Dennis,

Yes, you are right, the 897D has its DSP at an AF stage, not IF, since this model hasn't got an IF at a DSP range. (Latest brother of 897, has DSP at IF level and 10 kHz roofing filter)
However, re. AGC, I would strongly suggest you tweaked the AGC button manually until you were happy with what you achieve. I usually override the auto settings of the AGC and completely turn it off, then do all AGC gain, manually (use F key and then scroll to AGC, press relevant Function key, and try turning it off).

Yes the 300 Hz filter is the narrowest filter Yaesu sells. Inrad also come with their own implementation of filters for this radio ,same filters as 857D,
(http://www.qth.com/inrad/).
It doesn't act as IF DSP, however it still acts as a good IF filter and will limit a lot of unwanted strong signal effects on your target signal.

Hope this helps, and good DX-ing

Hello Graham,
I've replied once but it seems to have gone astray.
To set 50 MHz as the IF, I first tuned the FT897
to 50 MHz, then opened menu 089 , which showed
50 MHz, then I tuned up to 70 MHz with the dial.
I pressed F to enter it and then went to menu 091
and enabled transverter shift A. This worked fine
but you can't do it for a 144 MHz IF. Menu 089
will not allow the dial to tune down more than 100 KHz.
Apart from which you would have a lot of spinning to do.
I wish to use 144 MHz as the IF for 1296 MHz, but I'm
not prepared to tune for ever hi.

It also happens if the cw plug isn't quite in tight, and as usual Yaesu surround the socket with the case, so normal plugs struggle to just make connection, a fraction out and the barrel of the plug shorts out the whole cw socket

19855. Re: Transverter frequency set -men 89- how to set 70.000 Mhz ??

Yahoo group: FT897 (2007)
Date: 2007-08-20 11:20:54 UTC
From: bart_ghz
Topic: 19737 Message: 19855

I'll also tried it,but it is not possible to get 70 MHz on the
display with if of 144 MHz.
He could set is to 1070 MHz.
And for setting it to a high frequency (eg 1296) you dont't have to
spin the main dial till you get dizzy.

First you set you radio on your IF frequency (eg 144.000 KHz).
Then you go to menue 91 and select xvtr A.
Then you go to menue 89.
Then you puch the MEM/VFO-ch knob.There will be a line under the
number of hte frequency indication.You then can change the number
with the main dial.To go to the next digit,you turn the MEM/VFO-ch
knob and repeat it.If you are finished,you puch the MEM/VFO-ch knob
again.Then press the F button to go out of the menue.

The fun part is that,when you go into transverter mode,the
tranceiver automaticcaly goes the the meneimum power output.
If this is still too much power (for example the db6nt transverter
28-1296 can have 3 w max) you can adjust this in the service menue.

Hello Frans,

I hope you didn't bought the radio that i was testing last week from
a ON station.It had the same problem.We tried everything
(resetting,adjusting the processor level ,and so one).
A also posted a message in this forum one week ago

For the rest the radio was working fine.If you look at the
diagram,there is the possability that there is a problem with the
prcessor opamp (q1118) or the switch q1098).
It it also possible that the gain control chip (it also controls the
gain for other audio functions,so i presume this one is working
fine)).
The chipnumbers are from the diagram of the non d version.

But you probably have to messure andd see where the signal stops.

19862. Digital Modes and the Meter (internal or ext)

Yahoo group: FT897 (2007)
Date: 2007-08-20 21:07:57 UTC
From: alm7bc
Topic: 19862 Message: 19862

On my 857 the meter(s) always showed the tranmission of digital modes.
I simply looked for watts out and there they were.
On the 897 I don't see the same indication. Yes, showing power out but
only 15 or so watts when it should show 100? No, I do not load at 100
watts in real digital work. Just wanted to see the differance.
This is showing on both the built in meter and the LDG External Mtr.
So its a radio issue, not a meter issue.
Looking at the various menu's I do not see the culprit. Compared to
the 857 setup is very very close.

So whats up with the meter displays?

From: dj2pb
Topic: 19866 Message: 19866

Hi all!

Today the USB CAT-cable for my FT 897 arrived and after a few minutes the information exchange worked with programs like N1MM Logger, Win-Test...
My question now is, how can I use the CW output of this programs with my FT 897? I guess I need another cable/interface, or can I get my Transceiver to send CW with the CAT-cable?
After some research I found an interface called Winkey which is now also available for USB port (don't have RS232...) but that would cost me about $60. Is there any cheaper option to get it working? I didn't find anything about that in the manual.

Thanks in advance es 73,
Patrick

Tim,

Thanks for the suggestion. I tried turning off the AGC and playing with the RF Gain, and it worked well. I'm still using the DSP bandwidth filters, though, because they allow me to turn up the RF Gain higher without audio distortion. Still gonna order the 300 Hz Inrad filter, though....

Thats a very good point, and after plugging the Transverter 'rx
port' into my analyser , I found 3 carriers , one on 75 Mhz @ -71
dBm , one on 150 @ -51 dBm and one at 225 @ -75 dBm , according to
my signal gen a carried level of -50 dBm is 700uV (pd) ish

Oh happy day ....

So not only now do I know I cannot set the dial to dispay 70... but
the tansverter is responcible for the quatum leap in the rx noise
floor ... dose the name R&N ring any bell's ? after this . ru**y

OH .. I forgot to mention .. To correct this problem, simply confirm that the cw keying line is not closed and then turn off, then turn the radio back on again, and the problem should clear ..

My mode and band switches no longer function and transmitter will not key.

Anybody seen this problem before?

I tried a "power"+"home" button reset with no improvement.

Suggestions?

19871. 30 meter band shows up twice when using band "up" & "down" buttons

Yahoo group: FT897 (2007)
Date: 2007-08-20 01:46:54 UTC
From: shoeman8535
Topic: 19871 Message: 19871

I've only had my FT897 about two months and I'm still a little mystified by certain aspects of the radio, even though I've spent hours reading the manual. I'm having two issues currently I don't seem to understand:

When I first got the radio as you used the band up/down buttons, thirty meters band appeared once. Now, I get 10 Mhz and then the next band down selection ALWAYS yields 9999.97 Mhz. If I adjust the VFO to another frequency the next time through the bands its back to 9999.97.

Another issue I'm having is that I have found how to use the function setting to change the meter reading to SWR upon transmit, but then when I do transmit I get no reading at all on the meter.

Any thoughts/suggestions you guys would have would be much appreciated!

Topic: 19737 Message: 19872

Hello Graham,
I wouldn't think that you are getting any ill
effects from the spurious you mention.
-71 dBm at 75 MHz [and that's at the output
of the transverter, at the input it's less the gain
of the transverter, so that's less than 0.0001 uW
5 MHz above the signal frequency.
-51 dBm at 150 MHz, that's less than 0.01 uW
5 MHx above the IF frequency,
and -75 dBm at 225 MHz, that's less than 0.00005 uW
80 MHz above your IF frequency.
I can't see this doing much to your noise floor.

From: Ken Bandy
Topic: 19871 Message: 19873

The "extra band" on the 897 is a "feature", from what I understand. There has been talk about it on here in the past. Basically, my understanding is there is another memory slot, so to speak, for another band. If you tune "out of band", the radio will remember that and take you back there.

Regarding the SWR meter on transmit, if you are getting no reading on transmit, that's a good thing. That means your SWR is 1:1 or very close to it.

19874. Re: Optional filters for FT-897D

Yahoo group: FT897 (2007)
Date: 2007-08-21 11:33:30 UTC
From: tim pap
Topic: 19836 Message: 19874

Hi Ken,

Press the F key
Then with top right button (MEM/VFO CH) scroll to menu row "MFl" (lima) , and by pressing button B under the screen you can turn AGC completely off. (Wtih button C, while AGC is on you can set it to be either Slow or Fast)

When working with faint signals (e.g. CW) I turn AGC completely off, and this results into significant improvement of background noise (hence better S/N) by tweaking the SQL/RF manually (external concentric knob, next to the tune wheel).

Since the Automatic Gain Control will be OFF now, you will have to adjust this control manually. Once you get the hang of it though, you will like the difference very much.

This has always been my favourite way of copying DX / QRP with all radios I have operated over the years, as AGC can't discriminate between wanted and unwanted signal input, atmospheric QRN etc.. AGC, in my experience, does indeed result into masking very weak signals.

Let me know (when you do this in practice) if it has helped improve readability of very low signal RX.

73 from Dorset,
Tim M0SVA

How do you do automatic gain control manually?

19875. PSK on the 897 - increasing IF bandwidth?

Yahoo group: FT897 (2007)
Date: 2007-08-21 12:19:39 UTC
From: Toby Corkindale
Topic: 19875 Message: 19875

Hi guys,
I'm hoping to get an upgraded license soon, and will then be allowed to get into the PSK digital modes (among other things). I noticed that some of the PSK software can monitor across many channels at once, if you can open up your radio's IF bandwidth..

Is it possible to do that with the FT-897/857?
(I couldn't spot such an option in the manual in the pages about setting up for PSK operation - unless it's an automatic thing?)

Cheers,
Toby

19876. RE: [FT897] PSK on the 897 - increasing IF bandwidth?

Yahoo group: FT897 (2007)
Date: 2007-08-21 12:55:11 UTC
From: Ken Bandy
Topic: 19875 Message: 19876

Hi Toby. Good luck on the upgrade. The main software I use for PSK is WinWarbler, which is a part of the DXLab suite, available at http://dxlabsuite.com/. Anyway, there is no modification necessary to the radio, as the normal bandpass of the radio will accommodate many PSK signals. With WinWarbler, there is a broadband decode feature that will allow you to see any PSK signal in the bandpass. Also, the software will allow you to actually operate on 3 PSK "channels" simultaneously, in other words, having 3 conversations at once (if you're talented, hi).

Hope that helps.

73,
Ken

From: tim pap
Topic: 19836 Message: 19877

Hi Dennis,

Yes, glad you have found the AGC OFF way of copying helpful.

AGC can't discriminate between wanted and unwanted signals, QRN, etc so it can often spoil the S/N ratio, hence masking the weak signal, in ANY mode.

Have been using this way of RX over the years with ALL my radios I have had, and it's always been the secret card up my sleeve for better RX performance, hi-hi.

By all means get the 300 Hz fitler ! In my experience it is the best combination:
Xtal filter AND DSP. My old 857D radio sounds like a "grown-up" radio now with the YF-122CN I got over ebay.

If you are lucky and not in a hurry you can find bargain prices for this filter. Someone now is selling a 500 Hz filter (item 180150352433).

Personally, because of the skirts ratio, I would go for the 300 Hz filter, but of course if I found a cheap 500Hz, I would grab it straight away.

IF Yaesu (mid-range models) allowed us to combine narrow (eg 300Hz Xtal fliters preferably ROOFING FILTERS) AND DSP filters at IF STAGE, that would be a dream come true...

Hopefully, now that narrow roofing filters are becoming fashionable, we will see competition bringing them in the Japanese mid-range radios too. Especially if VHF roofing filters can be economically made for below 3kHz widths. :o(

Happy DX-ing and 73 from Dorset, UK

Hi Toby,
your default crystal filter has >2khz bandwith. So you can monitor each psk signal inside this range without adjusting your QRG. A psk signal has a bandwith of about 30hz. So you can theoretical monitor >2000/30 = around 60+ channels. Ok, wouldn't work in practice, but I guess you understand the principle. MixW for example is capable of monitoring up to 10 channels at a time. Sometimes I use this combination with 3 or 4 channels at one time.

Right, this isn't documented in the manual of the trx. Have a look to the psk-software guides. There you'll find all you need.

Welcome to PSK!

Hope this helped,

19882. Possible fix for J-7 problem - 897D

Yahoo group: FT897 (2007)
Date: 2007-08-21 21:46:48 UTC
From: alm7bc
Topic: 19882 Message: 19882

The inability to mod the 897d to MARS appears to relate to a bad IMN10 Surface mount Diode assembly.

At Jumpers 1-9 there are INM10 diodes, seems one is bad on my radio and since it does not effect the inband operation Yeasu will not fix it.

In order to get the Jumper 7 jumped to RTN2 at the chip to allow out of band I will have to replace a surface mounted iddy biddy diode.

Any suggestions as to the best way to proceed? Like can I simple replace the SMT with three conventional diodes? There is enough space available in the case for that.

Just curious.

Date: 2007-08-21 21:56:19 UTC
From: Dennis Featherstone
Topic: 19836 Message: 19883

Tim,

I went ahead and ordered the 300 Hz filter from Inrad. However, neither the Inrad guys nor Yeasu Tech support were able to answer (or even understand, I think) this question....

Assuming a hypothetical passband of 0 Hz to 3,000 Hz at any given frequency, where is the "filter passband" centered? Is it centered at 700 Hz for CW work, or can it be moved higher for RTTY, PSK31, etc.? If I have to confine my digital work to ~700 Hz, it's sort of difficult to get full TX power out that far from the middle of the passband.

Thanks!

From: Sholto Fisher
Topic: 19836 Message: 19884

Dennis,

I have the 300Hz Inrad and in USB it is centered on 1500Hz (approx), LSB it is centered on 1650Hz. On CW it is centered to whatever frequency your "sidetone" is. In DIG mode, you can shift it around using the DIG SHIFT option. I have mine set for 1000Hz center in DIG mode. You can shift it around in USB/LSB too using the IF SHIFT control but I can't imagine why anyone would want to use such a narrow filter in USB/LSB.

You can also set the rig to TX through the filter. This is the default for CW and could also be useful for narrow digital modes (<300hz bandwidth)

The 300Hz doesn't ring. It's a quality IF filter with a nice flat passband.

Sholto KE7HPV.

No .. those measurements are taken 'from' the transvertor 'input' ie
connection to the 2 meter rig (ft897) and represent what the ft897
is looking at on 'RX' ....

From: PERRY
Topic: 19889 Message: 19889

Had a 897d a few months ago and got nitch to try something else. Sold it.. got a IC 7000 - sold it.. Kenwood TS570S sold it ..
Just ordered the FT897D again, now from AES.
I guess I come back to a Great little rig that does it all for the best price. Was looking at the FT 450 but got cold feet to try it.. so it was the 897 that won out..

From: ukscanner
Topic: 19871 Message: 19890

I've only had my FT-897D a couple of weeks and I'ver also started to notice that the 10Mhz range appears twice when using up and down. I heven't got to the bottom of it yet though.

As for the SWR meter, it's actually very dificult to read. If you have very low SWR the meter doesn't seem to register at all unless you look very closely. I was so concerned about it that I bought the external LDG FT-Meter, which is very clear and you can actually see 1.1:1 on the scale. It's a great S-Meter too. Definately worth the money.

Graham.

I think the FT 897 remembers one frequency within every amateur radio band for both VFOs plus one frequency outside the bands. Try to turn the VFO to something like 5 MHz, then it should overwrite the 9999.97. I've had the same "problem" for 15 meters. I accidentally tuned to 20999.9 and then that QRG was stored until I tuned to a radio station outside the amateur bands which is now shown while switching bands with up and down keys.

19892. Copying MEM to VFO

Yahoo group: FT897 (2007)
Date: 2007-08-22 03:00:39 UTC
From: Toby Corkindale
Topic: 19892 Message: 19892

Hi guys,
I upgraded from a Yaesu VX-7R, upon which there was a key sequence to copy the current memory channel into the VFO. (Hold F for a second, then hold the "Internet" key for a second. Yes, I forgot what the sequence was a lot too!)

Anyway, I'm struggling to find the equivelent command on the 857/897 radios. Is there one? I know from the manual that I can tune off the current memory, but that's not really what I want..

The reason for me looking for this feature is that I'd like to use the dual-watch mode when in the memory banks.
ie. If I find a programmed channel that I want to keep an eye on, I'd like to copy it to VFOb, so that I can use DualWatch to monitor it while I'm on other channels or frequencies.
I know the PRIority mode achieves the same thing, but that is hardwired to check Channel 1, and I'd rather be able to choose what I monitor (either by freq or channel).

Am I going about this the wrong way?

Cheers,
Toby

I use the stock 300hz filter on digital all the time. Your receive and transmit are both centered on 1000hz passband. Full power no problem.

Firstly find out if all three doides in the pack are faulty, a simple test meter measurement. Then of course you only have to replace the duff diodes and the ones that have a jumper attached.

You could use a leaded diode, leave the pack in place andjust connect the cathode to the common point on the diode pack and the anode to the far side jumper pad (the one that is not connected to the diode. Job done, apart from perhaps securing the diode with a blob of glue or RTV, the pads are not very strong and won't take much pulling.

As lomg as the duff diode in the IMN10 has blown open, rather than
short, you can leave it in place and just add the leaded diode.

Jeff

It appears to be undocumented, but you can copy the MEM to VFO by
hitting the "A=B" option while on a memory channel.

So to achieve the Dual Watch on memory channels that I was after, do this:
1) Tune to first memory channel, hit "A=B".
2) Tune to next memory channel, and hit "DW".
3) Continue to tune around memory channels, and observe the radio
occasionally flicks back to check the first frequency.

Hi Toby,

This is a function I also would like to know the "correct" way to do.

I have found that if MFa (A/B A=B SPL) is selected when you are on a memory channel, simply pressing the 'A' key (A/B option) or the 'B' key (A=B option) will cause the selected memory frequency to be copied to VFO B (if VFO A was active) or to VFO A (if VFO B was active).

Just one more trick to try to remember!

73,
Brian

From: Charles MossIII
Topic: 19905 Message: 19905

I have an 897 and was working fine on PSK31 and WSJT. Run these modes straight from the sound card. I installed a wireless modem card (which is probably coincidental) and when I hooked the computer back up I could not transmit. I figured maybe the cable was messed up so after reheating all the solder joints and insuring everything was connected well I just ordered a new cable. Got the cable hooked it up and same thing....not able to transmit.

I feel as though there may be a blown diode on the input side of the data jack due to the fact that I can still receive and decode fine, I just can't transmit. Any recommendations? I do not feel comfortable attempting to replace a diode the size of a flea so any GOOD reputable service repair places stateside would be appreciated?

Any help will be greatly appreciated.

Hi

I am new to this list. I've been an active ham radio operator for over 40 years and have operated from several nice overseas locations in the past.

I've had my FT-897 for several months and only receently joined Army MARS. Of course I need to modify the 897 to transmit outside the normal HF Ham bands. I looked over the FAQs on this list and didn't see any TX mods to open up the transmitter section. Can anybody on this list direct me to a site or some PDFs that detail the mod to open up the TX, please?

Thanks

Rich W3OSS

19907. Aussie amateurs - how to TX on 420-430 MHz?

Yahoo group: FT897 (2007)
Date: 2007-08-25 02:30:55 UTC
From: Toby Corkindale
Topic: 19907 Message: 19907

The Aussie amateur frequencies include 420-450 MHz, but my recently purchased Yaesu seems setup to only TX between 430 and 450.. The 420-430 portion is reserved for people with the next higher ticket, but I'm aiming to have that soon, and was wondering what I need to do to enable my FT-857D to TX there? I gather from reading that recent models of the 857/897 aren't soft-moddable, but I'd rather not invalidate the warranty with the hardware mod.
(If I do go down that route, then which jumpers do I need for the Aussie model - are they the same as the US mods report?)

Actually, is this state of affairs normal here? The (authorised yaesu dealer) who sold me the radio claims that Yaesu simply don't offer a regional variant that matches the Aussie bandplan, although that does seem rather strange to me!

Any other Aussies here who can enlighten me?

Cheers,
Toby

I think you'll find there is some info in the files section under mods
that will help you. It's been a very long time since I messed with
mine. I think there are also some software mods that can be made
without messing with the jumpers. Some searching should point you in
the right direction.

Are there any new software mods since Widebanderv4 and softjump? Both of
those are unable to modify recent versions of the Yaesu firmware, sadly,
including mine.

cheers,

From: Bob Juneau
Topic: 19906 Message: 19911

If you have an older FT-897 then you can get the info at:
http://www.kb2ljj.com/data/yaesu/ft-897.htm
If you have a newer FT-897D, have yet to find the correct mod for an FT-897D
I opened my radio up and it looked completely different than some of the mod pictured on the web. I have even approached a guy who does mods professionally at:
http://home.comcast.net/~sllewd/
I was willing to pay the $60, but this guy said that he can't even get an updated schematic from Yaesu for the 897D.
If you hear anything different, let us know.

Subject: [FT897] New Guy & Mods needed

Hi

I am new to this list. I've been an active ham radio operator for over

40 years and have operated from several nice overseas locations in the

past.

I've had my FT-897 for several months and only receently joined Army

MARS. Of course I need to modify the 897 to transmit outside the normal

HF Ham bands. I looked over the FAQs on this list and didn't see any TX

mods to open up the transmitter section. Can anybody on this list

direct me to a site or some PDFs that detail the mod to open up the TX,

please?

Thanks

Rich W3OSS

From: THOMAS BRERETON
Topic: 19906 Message: 19912

Rich,
Having gone through this process, I recommend that you contact Yaesu tech support. Having made this contact, they will tell you to send a copy of your MARS license. They then will send you the approved
mod. I would also suggest that you look up DK Mods on the web where you will find mods for this and they
will supplement the one from Yaesu.
I know that some members of our group don't go through Yaesu and just use the DK Mods. Don't do this!!
The mods are difficult and if you screw up you will lose any protection from Yaesu.
Hope this helps,
Tom Brereton, W2TJO/AAR8AP

Take the wireless modem card out, just to be absolutely certain.
There is a good chance that your sound card settings have been changed
by your OS so as to allow the wireless card to operate.
Check all your sound card settings, and that the digi mode software
you are using is correctly accessing the card...

Make CERTAIN that you do not have a CW key or mike in TRANSMIT mode, and that the wiring/jacks to any accessories is not activating TRANSMIT, because if you power the radio ON in transmit, it will RECEIVE but fail to transmit! (Sounds crazy, but that is the way it is!) 73, KC3VO-Bob Curry

First, if you know what you are doing, the mods ARE NOT DIFFICULT. If you are not skilled to some degree with a soldering iron, then it might be best to find someone who is to perform the mods.

Second, the website is HYPERLINK "http://www.mods.dk"www.mods.dk (NOT dk mods).

Hope this helps

Unplug your interface. Run the program and send something through psk31. If you can't hear it on your computer speakers, check your interrupt settings for the sound card as they could have changed. You can also check the settings in the program for output selection.

good luck.

jim

19923. FT-897D + LDG AT-897 for Sale!

Yahoo group: FT897 (2007)
Date: 2007-08-27 23:51:07 UTC
From: kaboona
Topic: 19923 Message: 19923

Hello all, I have a Yaesu FT-897D in very good condition with the LDG AT-897 automatic tuner. The radio has been in and out of my shack as I have used it in my truck. It is a 9 out of 10 cosmetically. This was purchased in Feb '04 and it can be modded for MARS and others via software and without hardware mods. This one does not have any mods either via hardware or software done.
The tuner has the latest LDG firmware and works great with this radio. Excellent condition, I have the box and original mike and most of the documentation that came with it. I will need to find the manual as I cannot locate it now. I will include it in the shipment if I find it.
The price is $775.00 plus shipping from zip 02169.
I can provide pictures in a day or so to those who need them. Just e mail me at my call at com cast dot net.

Thanks for looking.

Hi Dennis,

your question may look like there is some misunderstanding about the
funktion of the superhet principle.

All the filters, you can by for this rig are 455,00 kHz +/- tolerances.

The placement of the "window" in the audio spectrum is the result of
the BFO frequency. For SSB it is 1.5 kHz offset 456.5 / 453.5, so the
center of the window is at 1.5 kHz in the audio spectrum.

In the CW setting, it can be adjusted. As well as in the digital mode.
Menu 38 Dig mode User, menu 39 offset.

So the manufacturers could probably not determine, how you have set
your rig :-)

Hope this helps

Regards
Chris

It is probably the wireless modem.

Does the rig key-up when you try to TX?
If not, then the software settings in the PC need
to be changed for the new soundcard and com port.

Good luck.

19928. Difficulties with FT-897D and ATAS-25

Yahoo group: FT897 (2007)
Date: 2007-08-26 22:00:56 UTC
From: kc8dsv
Topic: 19928 Message: 19928

Hello,

I'm new to HF and recently got a new FT-897D and ATAS-25 antenna. The FT-897D is being run off of the internal batteries. With the ATAS-25 around 145Mhz, the SWR is 2.0. Using a vertical 5/8 wave antenna on the car, it's just under 1.2.

However, when I switch to HF on the ATAS-25 antenna, the SWR is infinite. I've tried two different coax cables with the same result. I also checked the SWR on HF with the 5/8 144Mhz/440MHz antenna above and it also was infinite.

Any idea where to look next or what might be the problem?

G'day

Has anyone come up with a (Spreadsheet type) quick reference list of the most common menu settings instead of referring to the Manual all the time. I would appreciate a copy if someone has done it and would care to share it.

Many thanks

Navysparker VK4AQ

Any chance the "Mute All" checkbox inadvertently got checked in the soundcard mixer? Or perhaps the "Main" or "Wav?MP3" level sliders are at minimum in the mixer? Those are the two that get me by surprise all the time when I find zero output on PSK!

I'm not trying to be smart, but just want to double check that you are connecting the ATAS-25 to the HF/50 MHz SO-239 on the back of the rig when you change from 2 meters.

19933. External microphone

Yahoo group: FT897 (2007)
Date: 2007-08-28 17:52:28 UTC
From: Geoff Blake
Topic: 19928 Message: 19933

I am being lazy really, don't want to re-invent the wheel, but has anybody designed/built a hands free kit to a FT897D. I am looking to connect a headset to the radio and am looking for such info as the PTT and microphone bias details etc.

There is an excellent and simple design by G4VEH over on the FT8900 files section, but I doubt that the FT897D would be related. For example, the 8900 grounds the PTT line via a 27K resistor (IIRC), but it seem the the 897D grounds the line directly.

If anybody has done the research, or knows of a published design, I would be greatful of a pointer....

Thanks

Geoff

From: kc8dsv
Topic: 19928 Message: 19935

Ken,

Yes, that's a darn good question. Here's what I found but honestly should have known better. As I've found the ATAS-25 requires a counterpoise wire - clearly spelled out in the directions. It's also very sensitive to nearby objects. When trying to tune the antenna with a simple SWR meter, I was getting far too much capacitive coupling from nearby objects and was unable to tune it. I did not realize that was happening. That lead me down the wrong path. Finally I moved the antenna into a free space away from the house and sure enough I tuned right up on 40m with a SWR < 1.2. So, the lesson here is if your using an antenna like this, get it away from the building, at least 1-2 antenna lengths. Also critical is using the counterpoise wires and a SWR meter to tune it. Once I did all of this I was online within 1-2 minutes.

Hi VK6RO,
Luckily those of us in VK5 haven't lost any of the 420-430 band; most of the activity occurs above 430 MHz, though. As an 'F' call I don't have access to 420-430 yet, but will be going for my standard license in a few weeks and thus am interested in possessing a rig which does work there!

cheers,

Hi Dennis,

I thought I would pass your question to a X-tal filters manufacturer (in the US) to see how exactly they would answer your question.

Please find pasted both your question, and the answer as it was provided by the manufacturers themselves.

Hope (in addition to Chris's guidance), this reinforces and helps.

Kind regards from sunny Dorset,UK

Tim M0SVA

The default as I recall is 700 Hz. You can shift by pitch adj.

> Is it centered
>at 700 Hz for CW work, or can it be moved higher for RTTY, PSK31,

Hmmm.... doesn't work quite that way ... Transmit signal may go through the CFIL, Fil 1 ot Fil 2 as selected by Menu 088. Best way to setup for say PSK is to have the Collins SSB filter (nice and flat) and select it for the transmit filter, use the SSB filter to view the 2300 Hz spectrum of PSK signals. If you then need to narrow the receive bandwidth, then select the CW filter (front switch buttons) and MOVE its passband to the desired signal frequency using the IF shift control on the front panel. With RTTY when you operate split, the same thing basically is available to you. Hope this was clear.

YAESU FT 897D FOR SALE
The radio is in mint condition, works perfect on all bands with rapid AC adapters CD-24 and PA-26, one FNB -78 battery, and a LDG meter. All accessories work fine, never mobile. Radio works like it should be on all bands with no problems. No issues, no scratches, no dents. Original mic, manual, and boxes. $25.00 UPS GROUND SHIPPING AND INSURANCE USPS POSTAL MONEY ORDERS FOR PAYMENT..TO THE CONTINENTAL USA I really love this radio but unfortunately I have to sell it. It will be placed on QTH if someone is interested. Thanks for reading my ad.

Tim,

Thanks for the info!

I got the 300 Hz filter from Inrad last week and figured out the answer to my question (1,000 Hz for PSK, 2,125 Hz for RTTY, 700 Hz for CW, or wherever I set the sidetone freq, etc.). What's really cool is the way you can move the passband on any mode with any filter with the IF Shift.

I only have a sound card interface for the 897, so I have been using it almost exclusively for digital and CW. I use my TS-2000 for phone only at this point.

Chris,

Thanks for the info!

I know that this filter operates at the 2nd IF frequency, but I
didn't know how the radio was set up to translate that to AF.

I got the Inrad last week and have since figured out its secrets....

19941. FT-897D vs TS-2000 for digital/CW

Yahoo group: FT897 (2007)
Date: 2007-08-31 02:18:50 UTC
From: Dennis Featherstone
Topic: 19941 Message: 19941

Anyone have any experience comparing the FT-897D and the TS-2000 for digital and CW? I have a RigBlaster Plug 'n' Play for the 897 only so I haven't had a chance to operate the TS2K on digital (or CW, since I've never plugged my paddles into it).

Would it be worthwhile getting an interface for the TS2K as well (and some kind of Y adapter for the paddles), or will the 897 offer equal performance on these modes? I do have the optional 300 Hz filter for the 897.

Thanks!

Dennis - KE5KZX

> Dennis - KE5KZX

I owned a Kenwood 2000 for 3 years. I now own a Ft 897D. Neither
is/was my main radio - that honor goes to my ProII.

The Kenwood is a superior radio to the Ft897D .It has IF DSP VS AF DSP
in the Ft -897D.My main modes are digital and CW, 2 areas in which the
2000 excels. There is NOT a better radio now being made for computer
control. The Kenwood thrives on being hooked up to a computer, also
Ham Radio Deluxe has many bells and whistles just for the 2000.

Alas my Kenwood 2000 was not reliable. 2 final failures in 1 year made
me get rid of it.

Geoff,

Heil Proset Plus Headset/mic has a PTT connection for using a footswitch or pushbutton to key the mic. It is an adapter cable so that the same headset can be used on different rigs just by purchasing the appropriate adapter cable. $20 USD

Subject: [FT897] External microphone

I am being lazy really, don't want to re-invent the wheel, but has
anybody designed/built a hands free kit to a FT897D. I am looking
to connect a headset to the radio and am looking for such info as
the PTT and microphone bias details etc.

There is an excellent and simple design by G4VEH over on the
FT8900 files section, but I doubt that the FT897D would be
related. For example, the 8900 grounds the PTT line via a 27K
resistor (IIRC), but it seem the the 897D grounds the line
directly.

If anybody has done the research, or knows of a published design,
I would be greatful of a pointer....

Thanks

Geoff

I can't speak to the performance of the TS-2000 on CW/Dig because I haven't had the opportunity to play with one on the air. I can suggest though that utilizing high end technology (IF DSP, etc) does increase the performance characteristics of a radio, at a price.

For my part, I used an ICOM-720A for 25 years before replacing it. It worked well except for lack of computer control and front end intermod sometimes. In replacing it I looked at a lot of different radios and finfinally settled on the FT-897 because of it's price and performance. My unit is configured with both the Collins 500 Hz and 300 Hz filters for use on CW and Digital modes. My interface is RigExpert with MixW software.

For me this is an exceptional combination for all modes and all bands. I can highly recommend the FT-897, and do whenever possible, to new hams and old alike. If however you want the latest rig with the latest bells and whistles for CW and Digital, you may want to configure the TS-2000 for these modes.

19961. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2007)
Date: 2007-09-01 10:11:24 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 19961

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

Hi Jose

I don't have the FC30 but on my LDG100 ATU I have I have to tx on AM then press its tuning button briefly for the ATU to be able go through its operation to tune - as keying SSB wouldn't produce an output and the tuner appears to do nothing.

The FC30 may be similar?

Hope this helps

19963. RE: [FT897] FC-30 doesn't work at all on FT-897D. Can anyone help?

Yahoo group: FT897 (2007)
Date: 2007-09-01 11:05:59 UTC
From: Ken Bandy
Topic: 19955 Message: 19963

Jose, make sure the CAT cable is seated completely on both ends. Since the connectors on the rig are recessed, sometimes folks don't get the plugs seated completely. On some plug ends, there is even the need to trim some of the plastic from the "boot" on the plug to enable it to get in far enough. If you confirm that these are completely plugged, there is a surface mount fuse that is in line with the power output at the CAT connector in the FT-897D. You could check to make sure that this fuse isn't open by checking to make sure you have 12 volts where you should in the FC-30. Be careful if you do this, though! It doesn't take much to blow the fuse! I found out the hard way;-)

Of course, make sure that you have configured the CAT output properly in the menus, as outlined in the directions.

73,
Ken

19965. Problems tuning on High and Low Bands

Yahoo group: FT897 (2007)
Date: 2007-09-01 15:15:03 UTC
From: gastbury
Topic: 19965 Message: 19965

I'm having problems getting my AT-897 tuner to tune on the 160, 80, 10 and 6 meter bands. I am using a 300 ohm dummy load to test (home brew). I don't have an antenna set up at home yet and I haven't had time to throw up the 102 foot G5RV to test.

LDG tells me I must have RF issues, however, I have had a few 897D and AT-897 owners tell me they have never had problems. LDG just tells me I'm doing something wrong. Apparently when one has an issue with their equipment, this is often the answer they give. The tuner was sent back to them, they said all they did was an alignment on it, other than that it was tuning fine.

Does anyone have any suggestions? I live in a small town in the North of Canada, and at this point no other amateurs have a 897 that I can test it against.

Graham

YAESU FT 897D FOR SALE
The radio is in mint condition, works perfect on all bands with rapid AC
adapters CD-24 and PA-26, one FNB -78 battery, and a LDG meter. All
accessories work fine, never mobile. Radio works like it should be on all
bands with no problems. No issues, no scratches, no dents. Original mic,
manual, and boxes. $25.00 UPS GROUND SHIPPING AND INSURANCE USPS POSTAL
MONEY ORDERS FOR PAYMENT..TO THE CONTINENTAL USA I really love this radio
but unfortunately I have to sell it. It will be placed on QTH if someone is
interested. Thanks for reading my ad.

19970. ft897 battery

Yahoo group: FT897 (2007)
Date: 2007-09-01 17:44:12 UTC
From: BILL HUGHES
Topic: 19970 Message: 19970

Hi ALL
I am new to this, I have an ft897 and made up a battery pack from the files 11 x 1.2 @ 4100ma each mimh cells. What charger voltage and ampage should I use to charge it as it dose not say this in the files or the type of internal two pin plug type.
I will be most greatfull for the advise just want to complete the project.

19972. Birdie at 7.238 - What was the fix?

Yahoo group: FT897 (2007)
Date: 2007-09-02 03:52:38 UTC
From: aultox
Topic: 19972 Message: 19972

Did a search for birdie on this group and found a match. But no message with the cure.

I had this birdie show up at 7.238 a couple of months ago operating LSB after months of clean operating.

Similar to the one Joe Veast described in early 2006. Not coming in from the antenna, not in the switching supply. Very stable and annoying when operating on the High Noon Net at 7.240.

Anyone recall if there was a fix discovered for this one?

thanks!

19973. Batterys on FT-897D ?

Yahoo group: FT897 (2007)
Date: 2007-09-01 22:14:15 UTC
From: Scott
Topic: 19973 Message: 19973

Hi All,

I'm running this great FT-897D on two batterys from Yeasu.

My question is the battery voltage.

Right now I'm looking at the radio and the voltage is 13.1

Does the radio shutoff at a low Voltage number ?

And as the voltage gets lower does the radio performance get worse ?

Thanks for all your help !

Scott

19975. CW Auto for DIG Mode

Yahoo group: FT897 (2007)
Date: 2007-09-02 04:01:20 UTC
From: Harold Myers
Topic: 19975 Message: 19975

Does anyone know if there is a way to make CW Auto (Menu item 022) functional in the DIG Mode of operation?

I think this would be a nice feature to have so an operator could go key down to adjust peak power output and allow automatic antenna tuners to tune with just a carrier and no modulation.

Perhaps Yaesu could incorporate this in a firmware upgrade that wouldn't require any hardware changes.

The answer to that is a bit like the answer to "how long is a piece of string"!!

It depends on what type of charger you intend to use and how quickly you wish to charge the batteries.

Firstly it is not a matter of charger voltage, more one of chrager currrent. The batteries have a very low internal resistance and will pull as much current as your charger will allow, so you need some form of current limiting to prevent damage to either the ells or the charger.

For a simple "dumb" charger you should limit the current to a maximum of a 1/10 of the rating of the battery. This way you will will never damage the batteries no matter how long you may leave them on charge. So for 4100mA cells that is 410mA.

The down side of this is that it will take over 10 hours to charge the cells. The cells need slightly more charging than rated capacity to reach full charge usually 12-14 hrs.

You can of course charge them faster but there is then a danger of overcharging and damage to the cells. They will overheat and the faster you try to charge then the quicker they will heat and die.

The way to overcome this is to use an "intelligent" charger that monitors the cell parameters (usually a combination of one or more of voltage, current and temperature. You can either buy one or make one yourself based around one of the ic's that are available fot the purpose.

If you want to make a "dumb" caharger tis can be as simple as a resistor in series with your power supply to linit the current to a safe 1/10 C Value. The voltage of the psu is not critical as long as it is sufficiently high to allow the cells to charge fully, the series resistor does the work of setting the correct current. However, to charge at around 400mA will need a low value resistor and it will get

quite hot!!

Another way around the problem is to use a bench psu that has an adjustable current limit, and may be add a series diode to protect the psu just in case it does not like voltages being fed back into it.

Hope this helps.

You need to change some of the menu settings to make the mic work.

Look at the appendix of the 857 user manual, it's all there.

Scott, did you set the "mic sel" menu item to "rmt"? If not, it's menu selection 59. Other than that, I don't know why it wouldn't work. I use one on my FT-897 that I use for portable operations, but not with the internal batteries. I don't know if that would have anything to do with it or not.

Hi Ed,

check the files section in the folder FluX Research.
There are two mods mentioned.

I dont know if they are really working.
I tried the one for the master osc output (FXR02), but it did not make any difference. But the bridy is very weak on my rig anyway, so the benefit may
depend on the boared revision.

Scott,
As long as you have the mike working (and they do work well) you might be on the lookout for RF getting back into the radio via the MH-59. That had been identified as a problem on this group, and it did happen to me on a small scale. I followed the directions in the file section, and installed a small toroid core just where the cord goes into the mike. That took care of the problem for me.

My analyzer doesn't do UHF, so I just check the 2m performance. If that's good, the antenna will probably take power on both bands....

Basically, unless you have a huge run of coax, you should see a low SWR on both bands.

If you get that, then try working simplex and repeaters at 5 and 2 watts and see how it plays. If it feels right, then dial up the power. I use a mobile (Larsen) dual-band antenna on my balcony rail and I regularly work simplex on 2m as much as 60 miles, and repeaters further than that. Mind you, the repeaters around here tend to be situated on high mountains.

19991. TH-D7A(G) and GPS

Yahoo group: FT897 (2007)
Date: 2007-09-03 14:40:13 UTC
From: rabe_marsh
Topic: 19991 Message: 19991

I have a good GPS receiver: a GlobalSat BR-305 GPS with a cable kit for RS232 Laptop PC interface, that meets the Kenwood specs for GPS: NMEA 0813. The GPS works fine with my laptop streets and highways navigation program and shows up well on my GPS Utility program. I also can use it without trouble on my marine navigation program. However, the Kenwood doesn't seem to like it. I have checked the 2.5 mm plug connections, and they are correct.

When the GPS receiver indicates that I has a fix, I plug it into the Kenwood. Nothing happens. If I push and pull the plug from the GPS in and out of the Kenwood input a few times, eventually the Kenwood will display the GPS position from the receiver. The Kenwood will then accurately beacon my GPS position on APRS, and will repeat automatically the way I have programmed it. However, it will simply send the same original GPS position, no matter that I have moved several miles away in my car. The Kenwood gets stuck on the original position and will not update the new positions as I move. If I pull the plug out of the Kenwood, and go through the "push/pull" routine, it will get the new fix, and the Kenwood will broadcast that.

It sounds like there is something wrong with the TH-D7, but before I send it in for repair, I hoped that one of you could suggest some solution that I can't see right now.

Hi, Scott!
After my Yaesu battery packs have been fully charged and then left unused in the radio for about a month, I get a voltage indication of about 13.8 volts when the radio is first turned on. This quickly drops to a plateau of about 13.4 volts which it maintains throughout most of its discharge. Once the voltage has dropped to 13.2 volts, it continues to drop off pretty quickly.
The "recharge" LED begins to flash at about 12.2 volts and will continue to flash until the voltage has dropped to 11.0 volts. At this point the "recharge" LED extinguishes - but the radio stays on.
Info available at the "www.energizer.com" website indicates that the minimum voltage to which the battery pack should ever be discharged (they call it the EODV) is 10.8 volts. Discharging below this voltage risks damage to the internal cells.
On one occasion, I went off with the radio on and found it had turned itself off in my absence. I don't know at what voltage that occurred - but suspect it was below the 10.8 volt EODV minimum. The radio doesn't seem to to be programmed to protect itself by turning off prior to being excessively discharged (as is the case with the FT-817). So I always watch it when it's nearing the end of the discharge cycle and turn it off myself when it gets down to 11.5 volts or so.
The power output does drop off as your voltage falls away from the "plateau". I've never tried to check just how much - but it's noticeable on the power output indicator.
I've had my original battery packs 3.5 years and they've each been recycled 40 times and are still doing fine (fingers crossed).

From: Curt Givens
Topic: 19965 Message: 19993

Can you borrow a 50 ohm load and try it into that? The AT-897 is supposed to handle in the neighborhood of a 10:1 ratio could be at those frequencies 300 is too large a mismatch.

Just a thought.

To: FT897@yahoogroups.com
Subject: [FT897] Problems tuning on High and Low Bands

I'm having problems getting my AT-897 tuner to tune on the 160, 80, 10 and 6 meter bands. I am using a 300 ohm dummy load to test (home brew). I don't have an antenna set up at home yet and I haven't had time to throw up the 102 foot G5RV to test.

LDG tells me I must have RF issues, however, I have had a few 897D and AT-897 owners tell me they have never had problems. LDG just tells me I'm doing something wrong. Apparently when one has an issue with their equipment, this is often the answer they give. The tuner was sent back to them, they said all they did was an alignment on it, other than that it was tuning fine.

Does anyone have any suggestions? I live in a small town in the North of Canada, and at this point no other amateurs have a 897 that I can test it against.

Graham

19994. Re: [FT897] Testing New Antenna Setup??

Yahoo group: FT897 (2007)
Date: 2007-09-03 15:50:46 UTC
From: K.Greenough
Topic: 19985 Message: 19994

Hello Scott,
If you have easy access to the antenna then
disconnect the feeder, measure the SWR using
low power [make sure your radio will tolerate a
bad match] , the SWR should be very high, full
scale in fact. The lower the SWR the higher the
loss in your feeder. Assuming a very high SWR,
reconnect the feeder to the antenna and measure
again, the SWR should now be very low. If it is, then
your coax is fine.

From: K.Greenough
Topic: 19985 Message: 19995

As a further thought, if you can't get easy access
to the antenna but have another radio on HF or 6m
then feed low power on a band the antenna is NOT
for and you should get a high SWR.

Topic: 19996 Message: 19996

With that much mismatch, the type and length of feedline you are using, as well as the construction quality of your "homebrew 300 ohm load" will have effects on ability to tune. How about some DETAILS of your hookup, such as how the load is physically constructed, what TYPE of resistive elements you are using, how long and what kind of connecting wires/cables you have, etc?----73, KC3VO, Bob Curry

Hi Don,

Many thanks for your great infomation on the batterys, I now know
Not to go under the 10.8 volts

I will stay on the safe side and not go under the 11.0 volts
then the light stops blinking.

Are these battery made in Japan by a Japan company ?

Thanks Scott

From: Richard
Topic: 19999 Message: 20001

The power level is continuously variable: from 5-100 watts on HF, 5-50 watts on 2m, and 2-20 watts on 440. The setting is in the menu, described on page 55 and 61. Menu item 75.

It is, in my opinion, a very nice radio; I think you'll be pleased with it.

From: Ken Bandy
Topic: 19999 Message: 20002

Hi Scott. The power level settings are in menu 75. The power level is infinitely variable from 5 to 100 watts in HF and 6 meters.

I have had my FT 897D for around 3 years, and have been happy with it. It's not an Icom 756 Pro III, or any of the other richer featured rigs, but then it's not priced as one, either. It's a solidly built rig, and very convenient for pulling and going portable, either with the built in batteries (max power out 20 watts), or with any other power source. Also, if you purchase the built in power supply (FP-30, I believe), you loose the capability of using the batteries, but you have a self contained rig then. One more thing, if you get a bolt on tuner, get the LDG AT-897, not Yaesu's FC-30. You will be much more pleased with the capability of the rig/tuner combo.

One word of caution, the FT-857 and FT-897 are basically the same rig, just different packaging. All in all, a very good rig, in my opinion.

73,
Ken
KC9GLQ

> Are these battery made in Japan by a Japan company ?

Hi, Scott!
I don't know where the battery packs are made. The MH-31 dynamic microphone that came with my FT-897 is in a box which has on it: "Vertex Standard Co., Ltd. - Tokyo, Japan - Made in China". So I guess Japan is subcontracting much of their production to China as are so many others.
I have had such good performance from my Yaesu packs that I don't think I would consider a substitute. This past Field Day, I used the FT-897 and a Buddipole for my outdoor excursion. Each of the two battery packs ran for 3 hrs and 45 mins before being discharged while running 20 watts in the CW mode. I made 43 contacts on the "A" battery and 39 on the "B" battery. How's that for uniformity? And, as mentioned before, these packs are three and a half years old. From my perspective, Yaesu got it about right on the FT-897 system!
One thing that I have noticed, however, is a change in charging characteristics over time. I use the Yaesu charger to recharge my packs. As you probably know, it and the packs incorporate some circuitry to prevent the packs from overcharging or overheating during the charging process. For the first couple of years, my packs would recharge for 3 hours (almost to the minute) before completing the charging process - all in one uninterrupted session. Now, however, they sometimes stop charging after 30 minutes to an hour or so. When this happens, I just wait an hour for everything to "cool off" and begin again. I continue this until the cumulative charge time is 3 hours before stopping. The battery packs continue to perform as expected. (I discharge and recharge them monthly if they are not used otherwise). I am attributing this quirk to changes within the cells themselves over time. But I guess the charger itself could be responsible.

Scott

Have a look at the June 07 discussion on the audio under :
RECEIVE AUDIO FROM FT897 : on this group. There are some useful
comments and suggestions and mod tips. I also have a FT817 and find
the audio quality better; and the control of the TX power levels
easier, using the "FUNC Keys" rather than going through the Menu.

I think this is a "downer" with the design of the 897 as I consider
power adjustment as an important operating control on amateur
transceivers.

Scott, I briefly used a Kenwood TS-130S, and compared to it, I would say the 897's audio is comparable. However, as I have seen several folks note, if you want to improve your receive audio quality, invest in an external speaker. The rig's speaker is pretty small and puny. I use a Heil headset for most of my operating. The audio quality is fine with it.

73,
Ken

Great, I found it, #75. Thanks, also how is the RX audio in your opinion. Is it as good (IMO) as a FT-817ND, if you know? I thought the RX audio of the 857 was a little rough sounding and was surprised that it was not as nice to listen to as my FT-817ND. I have never heard the RX audio of a FT-897, although the TX audio was good.

Hello Dave,
You can , via the menu, use the channel
select knob as a power level control.
That's what I do, it's very convenient.
You just give the knob a push and it
becomes the power control, push it again
and it reverts back to channel and
menu selector.

Hi Scott,

I use an external speaker on my FT-897, the internal speaker isn't a patch on the FT-817.

As it doesn't look like I'll use the FT-897 for portable work (bought used with one battery pack and charger) I may sell it on and put an FT-847 into the shack. I have a Tokyo Hi-Power HL-50B to go with the FT-817 if I wish to use it as a 'base station' away from home.

Hello Ken,
It's menu No 057. It lets you decide the
function of the mem/vfo ch knob when it's
pressed. You can select between a few options
one of which is RF power.

Hello Dave,
I'm pleased that you found that "tip" of use.
I use this feature a lot, it allows very quick
change of power levels to suit the contact.
It does have snags though, if you're as forgetful
as I am. I often forget whether the knob has been
pressed or not and when rag chewing on 6m FM
I attempt to change power and end up talking to
myself on the other end of the band. [One very
good reason for not having widebanded Tx mod'].

Since your suggestion I found another way of accessing power level control using the menu items 065, 066, 067. With this the A, B, C FUNC Keys can be assigned respectively to directly call Menu Options when in Operation Function Row "q" (Row17). I have assigned 075 RF POWER SET to A and 080 SQL/RFGAIN to B. Works well. This may solve your problem with the ?? status of the MEM/VFO DIAL Knob.

I notice that you can do the same thing if using the MH-59a8j microphone buttons via menu items 068 thru 070.

If you know about this one and have tried it, have you noticed any snags? I will try both methods and report my findings for your and other group members information.

Thanks Ken, I will find it useful too. I keep finding 'extras' on
my 897D that will be useful.

I am taking the '897 to Italy tomorrow and may play with HF if I
have time. Couple of off topic questions, what prefix should I
use, I will be about 60k south of Pisa in Tuscany, perhaps
somebody here will know. I know 6m FM is not used in Italy, is
there much on SSB?

20022. Re: Noise on transmit (SSB) - a possible solution -Arg!

Yahoo group: FT897 (2007)
Date: 2007-09-04 03:59:14 UTC
From: "Glenn (KØBO)"
Topic: 20022 Message: 20022

I've been told I have this same problem tonight. I have never noticed it until I used a general coms receiver to listen to my own audio. I first thought it was the proc bringing up my background noise between words but I tried a whole plethora of test to rule this out.

Disconnected all cables but mic and power.

Different mic (custom headset mic)

put RF chokes on mic leads, power leads and around coax.

still have the problem when running into dummy load

tried another power source (Battery)

keyed up xmitter without mic (using short RJ11)

mic gain at 20 with and without proc (proc changes pitch)

DBF on and off

I did the SSB bias adjustments about a month ago and had good reports. This was something that was brought to my attention while on a 2m SSB net. (FM mode is fine btw) I suspect the noise is masked on HF. I'm not sure if the SSB bias adjustment screwed this up or what but I thought the bias adjustment only effected the HF side anyway.

Anybody have advise where to look for this problem?

Should I send it back under warranty repair?

Other notes:
When listening with a wide band receiver, there seems to be a ~200hz tone on the audio when the proc is turned off. (tone encoding was confirmed off)

The sound was kind-a like a filter ringing or like listening to a long paper tube that was resonate at one audio freq.

Thank you all in advance for your help.

>
>Re: Noise on transmit (SSB) - a possible solution
Alax, I tried your suggestion in turning off the DBF to eliminate the noise in transmit. I monitor my output with a Motorola Service monitor, and the noise is still there, but the sound changes. It now sounds like hash instead of some kind of data. It would be nice to have a fix that would eliminate the noise completely. On my 897D the noise is 40dB down from the carrier which puts it within spec., but

when the band is clear, the ham that I am in contact with can hear
the noise. Not a good thing for a radio that is supposed to be so
good. Roger--- In FT897@yahoogroups.com, "whynotbecreative"

I have a FT 817ND and like so much I am thinking of an FT 897D as well. I've downloaded the manual and for the life of me can't find anything about power levels. What are the available settings? Are they 4 steps like the 817? If it's in the manual I apologize but I just don't see it, perhaps tell me on what page. Are you happy with the rig, looks sweet to me. How do you like the receive audio, my 817 is real nice, but I heard a FT 857 and it was not too good, can any one comment. Lots of questions I know and I hope it's not a bother. cheers, scott. kg6brg

From: Tom Porritt
Topic: 20025 Message: 20025

I am new to this group. Have owned my FT897D for about a year and used it mainly at home. The rig seems to have developed an internal short. Everytime I try to power up, the power supply trips out. Did a search of the messages here but did not find this problem addressed. I have sent it out to Yaesu Repair in California and they could not duplicate the problem. Got it back today and it still trips my power supply. I have used the power supply with other radios (tonight included) with no problem. I have thoroughly checked my power cable, no short there. I have tried powering it directly from a 12v car battery, same result. Anybody else run into this problem?

High SWR can get into the regulator circuit of your power supply and
cause all sorts of strange action. Shutting down is the least severe.

Exactly, how did the 12v car battery "trip out"?

From: K.Greenough
Topic: 20025 Message: 20027

Hello Tom,
I had to repair a FT100 that behaved exactly as
you say your FT897 does. I found that there was
an initial surge of current when the radio was
turned on that tripped the PSU. I never found what
was causing this, the owner of the radio used a
different PSU and had no problem. I was using a
PSU that could deliver 30 Amps so it must have been
quite a surge. My mind turns to a capacitor somewhere
on the input supply line but I never found it. I know it
was only a surge because I connected a 12v car head
lamp bulb in series with the supply, thinking that there
was a short, the radio now turned on and if I shorted the
bulb after the radio was on it worked perfectly.
I assume that your PSU is able to supply 25 A or so, but
then as the set is on receive when switched on the demand
should only be a couple of amps. You will likely find that if
you run your radio on a car battery it will operate OK.
I would get it back to Yaesu again, there's obviously some
fault.

Hello Geoff,
When there are sporadic e openings the bottom
of 6m is full of Italian SSB stations, so there's
plenty of them. Whether they're active without
lift conditions I don't know. If they are like us
in the UK the band is dead under normal conditions.
A couple of us try to keep activity up, at least on FM,
but it's a struggle.

Thank you for your help Curt. It is actually a 150 Ohm load. My mistake. This would make it 3 to 1.

John, the main operational difference that I know of is the addition of the 60 meter "channels" on the "D" model. I would assume there are some other less obvious internal updates maybe.

From: Ken Bandy
Topic: 19999 Message: 20034

Hi Ken, I just tried the RF power selection in menu 57. From what I can tell, there really isn't any visual indication of what you have set it to using this method. When I press the knob, I see a little "flag" come on in the upper line of the display, but nothing else changes in the display. If I turn the knob one way or the other, and then go to menu selection 75, the normal power setting selection, the level has changed, but there's no way of telling how much until you go to 75.

Did I miss something, or is this the way it operates?

I was unaware of it until it was mentioned here, so I went to the trusty 'ol manual, found how to set it up, and came to the same conclusion you did. I also need a visual indication of what the power is set at, so I changed the knob back to it's default setting. Another thing you can try is to set the function keys under the display to whatever you want. I set one to power and another to Squelch/RF gain, for the Sql/RF gain knob. Those are menu items 65, 66, and 67.

Hi Glenn.

There's a fix at www.mods.dk. It is from an italian ham radio operator.

It works both for the FT-857 + FT-897 as their main PCB is identical.

The fix adds one simple wire bridge on the lower side of the main PCB to shorten the internal DC-resistance of a small SMD RF coil. Then both grounds, the DSP ground and the common ground, are on the same levels or potentials.

I heard as well that a non-soldering fix should be to activate the DSP on TX, like Alex told. I never tried this.

But the DSP filter limits (100Hz / 6.000Hz) do only affect the RX sound characteristics, not the TX one ! For TX only the fixed stored settings of "HPF, LPF, BOTH" are available and only YAESU knows to which upper/lower audio frequency limits this is set to. But you cannot affect it from outside !

So to activate the TX DSP might be a solution, but I think it doesn't help at all (as it does not fix the real problem). But on the other side it might or will NARROW your TX audio signal. And "limiting" I never liked !! Hahaha....

For the fix just have a look here:

Hello Ken,
If you adjust the control whilst transmitting
you can see the bargraph display which
indicates RF out alter. Much more obvious
on FM, AM or key down CW.
Of course if you want to set to a known power
level, ie some exact number of watts you will
need an external power meter. The bargraph is
only a guide. Likewise the number value when
you set power by the menu is only an approximation.

High-stability TCXO, formerly an option, is standard on the D. Also,
from what I've read, software freebanding is no longer possible on the
D. (I haven't tried it on mine.)

Cheers -d

20044. Re: Noise on transmit (SSB) - a possible solution -Arg!

Yahoo group: FT897 (2007)
Date: 2007-09-06 19:41:11 UTC
From: pe1dcd
Topic: 20022 Message: 20044

Hi Jochen,

My FT897 has SN: 2N070xxx (2002, Dec, lotnr: 07).
Slowly I am started with modificatons on my FT897 (78S10 and bias of HF-PA, VHF/UHF-PA, Exciter, driver and pre-driver).
The TX-ALC is the coming step.

But I did read in the FT897 Yahoogroup recently that you now have a better processor-mod (15 nF parrallel to R1436) than the mod (diodes) you made in your PDF.
Could this mod also be done with my FT897?

You also told that you did also new mods (by removing 2 caps) for more audio hifi.
Is that with the previous mods from your PDF?
Is it possible that CTCSS-tones coming out of the speaker (with or witout DSP) when you mod the RX audio-stage (C1519, C1540, C1542, C1550) and your new found mods?

Can you give, in your opinion, wich mods need to be done in the 1st place (urgently), 2nd place ...and so on.
Off course, the audio mods are sort of personel opinion.
My voice is a kind of bassy....

I find out that the audio-out (Data-connector 1200bd) is not 600 ohm according manual.
I meassure a value of 5k7... and indeed....R1563 (1K) and R1586 (4k7) are in series.
This is also for audio-out 9600 bd; R1661 (1k) and R1583 (4k7) in series.
When you build an audio-interface (PSK31, RTTY.....) and termanate it with 600 ohms, than you have not the level of approx 100 mV.

' 73 and looking forward to hear you...
Peter , PE1DCD

20045. Re: Noise on transmit (SSB) - a possible solution -Arg!

Yahoo group: FT897 (2007)
Date: 2007-09-06 19:45:24 UTC
From: pe1dcd
Topic: 20022 Message: 20045

Hi Jochen,

My FT897 has SN: 2N070xxx (2002, Dec, lotnr: 07).
Slowly I am started with modificatons on my FT897 (78S10 and bias of HF-PA, VHF/UHF-PA, Exciter, driver and pre-driver).
The TX-ALC is the coming step.

But I did read in the FT897 Yahoogroup recently that you now have a better processor-mod (15 nF parrallel to R1436) than the mod (diodes) you made in your PDF.
Could this mod also be done with my FT897?

You also told that you did also new mods (by removing 2 caps) for more audio hifi.
Is that with the previous mods from your PDF?
Is it possible that CTCSS-tones coming out of the speaker (with or witout DSP) when you mod the RX audio-stage (C1519, C1540, C1542, C1550) and your new found mods?

Can you give, in your opinion, wich mods need to be done in the 1st place (urgently), 2nd place ...and so on.
Off course, the audio mods are sort of personel opinion.
My voice is a kind of bassy....

I find out that the audio-out (Data-connector 1200bd) is not 600 ohm according manual.
I meassure a value of 5k7... and indeed....R1563 (1K) and R1586 (4k7) are in series.
This is also for audio-out 9600 bd; R1661 (1k) and R1583 (4k7) in series.
When you build an audio-interface (PSK31, RTTY.....) and termanate it with 600 ohms, than you have not the level of approx 100 mV.

' 73 and looking forward to hear you...
Peter , PE1DCD

20047. Re: Possible fix for J-7 problem - 897D

Yahoo group: FT897 (2007)
Date: 2007-09-06 21:38:38 UTC
From: alm7bc
Topic: 19882 Message: 20047

Followup:

I ended up sending the 897 back to Yeasu for possible fix action.
Went in as a fully functional Ham Radio.

They called today informing me the repair CANNOT be done and the only cure is to replace the entire board at a cost of $800.00. Insane you say? I agree.

So the radio is again coming back to my as a fully functional Ham Radio. My eyes are no longer good enough to do work of this kind (replace an SMA diode). So am considering reselling the radio as a full Ham radio and not capable of the MARS Mod and then looking for a replacement that is either modded or one that I can get modded.
Am also looking to the local kit builders for help. Maybe there is a local here who can do board level (SMA) work. All I know is I can't and Yeasu won't.

So if your buying a Yeasu and you don't feel you can accomplish this rather easy but very small mod. Get the vendor to do it, can tell you AES won't do it. HRO will.

Thanks to the responders on this.

Can a cable tv inlet(medal adapter} cable be used as a ground by clamping copper wire to it then to radio radio??

Not a good idea.

You need a wide metal strap to your ground using the shortest possible route (length). I use 3" wide X 1/16" copper (galvanised steel of same dimension would also be suitable) There is no simple way unfortunately.

The earth you describe would be next to useless and would have potental to cause interference and damage to the other sevice.

Don't even think about it; it's a bad idea! You need to run a separate wire to a ground rod. It's best not to use any utility ground, because it may not be properly grounded or, at the very least, it'll likely introduce noise into your radio.

It's Dave again..

A counterpoise wire is one way out of the problem you have, and also the MFJ unit. There is plenty of good info on this subject in the Radio Amateur Handbooks. You still really need some sort of efficient RF path to ground though if at all possible. You didn't say if you are intending to transmit, but I assume you are using an FT897, as you asked the question of this group.

I support Richard's comment as well, re introduction of noise into your receiver. All sorts or electrically generated noise ends up flowing on electricity supply safety earth conductors.

Cheers and have fun..

Luckily I'm in a single story house; I have a hole in the floor that I run all my coax, so it wasn't a big deal to add a ground wire to a ground rod just outside.

Hello dr friends.

I have uploaded some vhf/uhf qso videos during my recent holiday on Lefkas Isl. that you may want to check. Propagation was poor during these days but there I managed to work stations fm 6m-70cm bands.

1) vhf tropo qso between sv1eex/8/p and 4o3a Present is also my gd friend sv3gke/8/p.Freq is 144300 qra KM08HR.Ant: 8 el-i0jxx Height 998m asl.Date 1/9/07.

http://www.youtube.com/watch?v=M9XnGCoX1Oo

2) Also a vhf tropo qso between sv1eex/8/p and 9a7b with sv3gke/8/p. You can also hear sv8cs.Freq agn 144300,# KM08ÇR>JN83HG qrb ~606 km .Ant: 8 el-i0jxx.Height 998m asl.Date 1/9/07.

http://www.youtube.com/watch?v=Z2hz5hqU5Ew

3) This is a uhf mobile tropo qso in ssb between sv1eex/8/m and sv3gke/8/m and the italian station IK8OXQ. Freq is 432.000 . Date 31/8/07 Time:1:58 am rig:ft-897d power<15w ant:dual band v/u mobile

Also I worked on VHF Iz7geg in my car at 144.300/USB with tropo pwr< 5W loc:km08ir>jn80up with my FT-817 qrb ~ 335 Km

http://video.google.com/videoplay?docid=-3372636431736918935&hl=en

Due to the catastrophic fires this year the contest was called off by Radio Amateur Association of Greece. So at least we managed to give points for the contest to the contesting stations abroad and have some great time mountain-top!

I was just looking thru the HRO catalog that came today and they do not list the MH-59 mic for the Yaesu FT-897 anywhere. Has this mic ceased production?

Having just renewed my interest in this nice radio, I thought it would be a good idea to obtain a MH-59. So, does anyone have a MH-59 that they want to part with?? If so, PLEASE contact me off-list.

My shack is about 20ft above ground level. I use silver plated multi stranded HF welding cable as my earth. Many look for a braid for the earth since that is a good source of a fine multiple stranded conductor, but any fine multiple stranded conductor will do, this is due to the effect where RF only travels in the outer surface of each strand, a pipe being as good as a solid bar of the same diameter. In big commercial transmitters they actually use pipe because it's lighter, older it all up the silver plate it to get a low surface conductivity. The problem is the people that get it wrong use common house hold earth with about 7 or so large copper conductors, but there are other sources of multiple stranded wire, trirated panel builders cable is commonly available, whilst not 100% ideal, isn't actually that bad, it has many fine strands, you can buy a 100m reel and use several lengths together.

I also bring all coaxes to a lightening arrestor and earthing block, big chunk of alloy with GDT's and RF connectors on either side, which is close to the ground before it enters the house.

I also use baluns on all my antenna's, some air baluns, some stub, some toroidal which should kill any external RF before it gets to the lightening block.

My shack is very RF clean, and I mean really clean.

From: Jochen - DG2IAQ
Topic: 20022 Message: 20062

Hi Peter.

Yes, you're right. I announced I think (now) 2 months ago to upgrade my "DG2IAQ mods" and publish the new ones as well.

Unfortunately I'm totally running out of time due to my main job and after returning home I do not have the menthal energy to work on this yet (cause it I S a "work",..hi.).

And only since beginning of July (so only for a period of 2 months) I received 50 (!!)direct emails from users asking for help. Those emails NEVER can be quickly answered with a short "YES" or "NO". Therefor I also was not able to answer any of those mails yet. Or I used my freetime at home to recover or do much more funny things. It's really hard nowadays to be "Mr. Yaesu Bible", ...hahaha... But people seem to have that imagination of me, ..hahaha...

But the FT-857/897 upgrade mods are not forgotten, don't worry.

During my vacation in Denmark beginning of August 2007 I took my IC-706MK2G with me. I also did great audio mods for this (very, very popular) type of TRX. Everybody asked me where you could buy my headset cause it sounded great (with my only 100 watts). But it was NOT my cheap 3.50 EUR / USD 5.00 computer headset, ...hi.

And I never spoke about this, otherwise my postbox will be killed ! Promised !!!

Uuuups, ..now I talked about anyway ! Hahaha...

You're questions are added to my "To-Do list" now as well and I try to put everything into a "FAQ" page, otherwise I often had to answer one and the same questions several times in the past.

As I'm running a 1-man business for finance/bookkeeping in my freetime (to earn the additional money, needed for my ham radio hobby) this has absolute priority now and the period from September - March is the so called "hot period" every year.

Nevertheless I try to work on the FAQ in parallel. But with all these mods/FAQs I don't earn any money, so please do not expect too much in too less time. Sorry.

Best 73,
Jochen

But to answer one thing rapidly: YES, you can do the mods also on your older serial-no TRX. On the old ones you did not hear any

significant difference on Speechprocessor ON or OFF. The newer ones (I think later than serial 4xxxxxxxx) have a working speechprocessor as YAESU did a fix with this 1 additionally capacitor.

On mine ("reference") FT-897D (..hi..) I tried a real AF-diode-clipping method instead with also great results, but it's much too tricky. Especially if you like to use the 897 for its originally usage -> OUTDOOR !! Or the FT-857 in the car.

Here the mechanically stress is much too high, so additionally parts or solderings might break as the soldering dots are much too small and cannot take all the mechanically weight of the parts.

On future projects I'll try to make some "wax drops" on them to shift the mechanically stress into the wax. If once you have to repair it anyway the wax is easily be removed (better that to glue the parts !!)

So I would prefer the YAESU "1-cap speechprocessor mod" instead. The diode version sounds cleaner and more "metallic", but the 1-cap sounds also great enough on all newer models.

That's for now. I'm actually at the lunch break in the office and have to continue working now.

More to come soon. Promised !

I am a second floor ham and have been on the second floor for nearly 20 years. I originally installed a braided strap to earth ground via the shortest route possible. It did not work out well. I then installed a 3/4" copper water pipe from shack to earth ground. The 3/4" comes up and through the side the house into the shack. I then soldered 1/2" braided copper straps to the 3/4" and run to each piece of equipment. For me it has worked very well for well over 15 years.

20064. New mic a bit quite

Hi everyone..
Ive just acquired a new mic Yaesu MD-100 a8x. Mp problem is I think it is a bit on the quite side.. I have been through the menu and played with mic gain and dsp mic equalization to improve it... I would like a bit more punch out of it as I'm used to a good punchy audio on my icom with a sm8. I have found the hidden menu by pressing the up & down buttons and powering up but cannot see anything in there that could do the job.
Anyone with any ideas would be gratefully accepted...

Ian

Before you start buying additional equipment, what is your antenna configuration and what are you expecting your "ground" to do for you? You've been getting responses that relate to both lightning and RF grounds but you mention using an MFJ artificial ground, which is strictly an RF thing. Are you interested in this for lightning protection, do you think you need a ground for some RF reason, or do you want it to cover both areas? In short, what problems and concerns do you have that you are trying to address?

To Peter PE1DCD and the group. some already know this.
The 600 Ohm out of data connector is AUDIO REACTANCE 600 ohms.
and cannot be measured like ohmmeter of 2 resistors in series.
It is like RF inductive and capacitive REACTANCE.

As the unit is still under warranty, I'm simply going to send it in for repair.

For the curious, I have documented the artifact. The radio was setup using the factory default settings for the SSB audio and proc. Unit was tuned to 144.170 into a dummy load with a IC-8500 near by. The first two test are with the transmitter keyed using a test jumper and with the mic input and mic ground shorted. The second test is the factory mic with the EQ switch set to "2".

http://www.vambo.org/tmp/FT897SSBxmit-noMic.wav
http://www.vambo.org/tmp/FT897SSBxmit-noMic-proc.wav
http://www.vambo.org/tmp/FT897SSBxmit-aircheck.wav

Though the audio sounds over compressed at the default ssb mic gain of 50, I feel it best will demonstrate the audio issue to the service tech.

I'll respond to the group with the warranty results.

Hi Ollie,

I did use a communications testset of Rohde&Schwarz (CMT).
It was giving a signal on 145Mc , 1Kc tone with a deviation of 3Kc.
Then I found at the 1200bd audio out about 200mV (open circuit).
And when I did terminate the 1200bd audio out with a 5k7 resistor I
found about 100mV.
Sinds the outputimpedance of the OPAMP is relativly low and there are
2 resistors in series (4k7 + 1K) at the output of this OPAMP
(according diagram), I think that I did it right.
Do I mis somthing?
